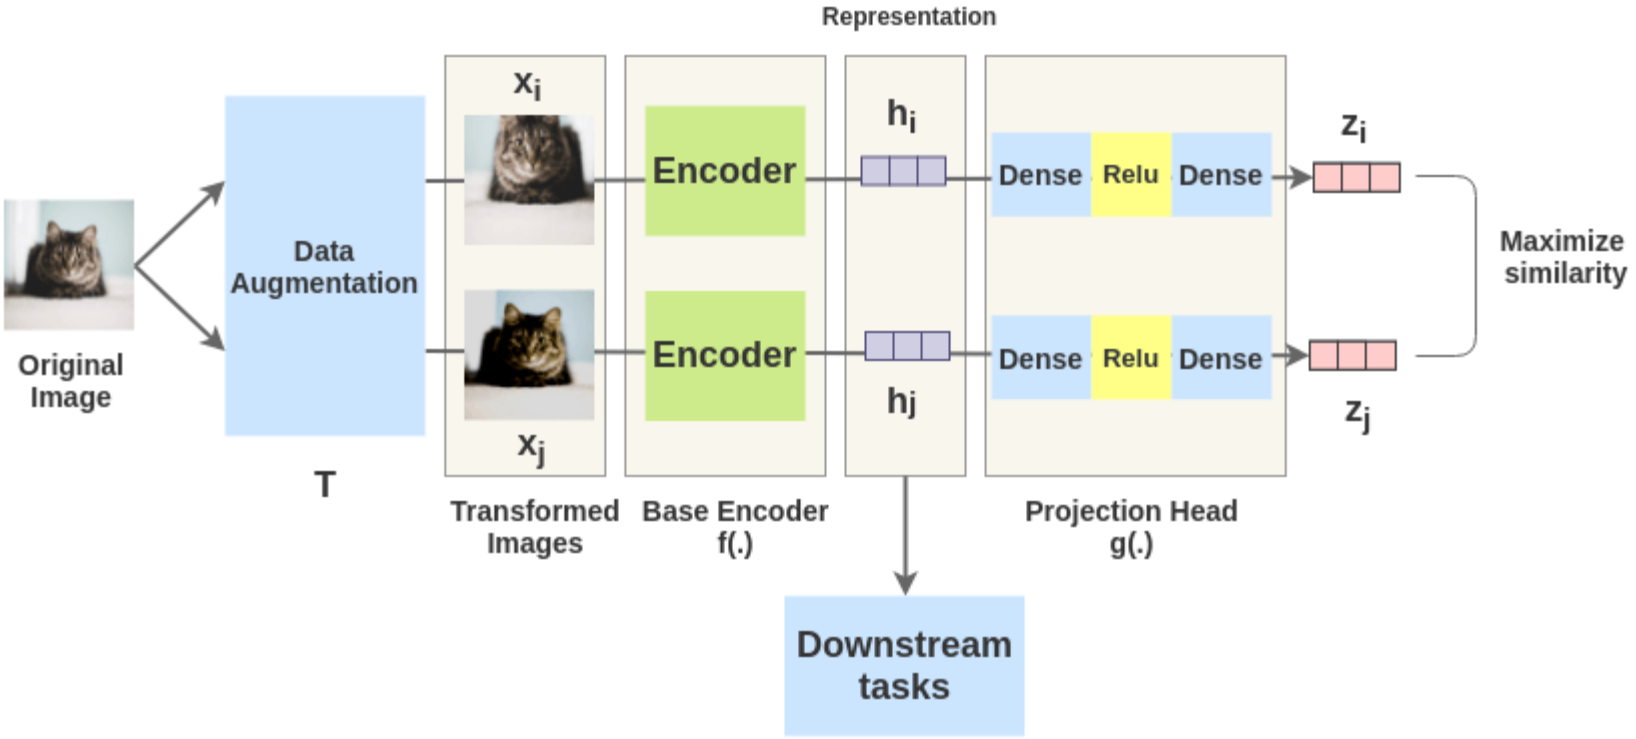
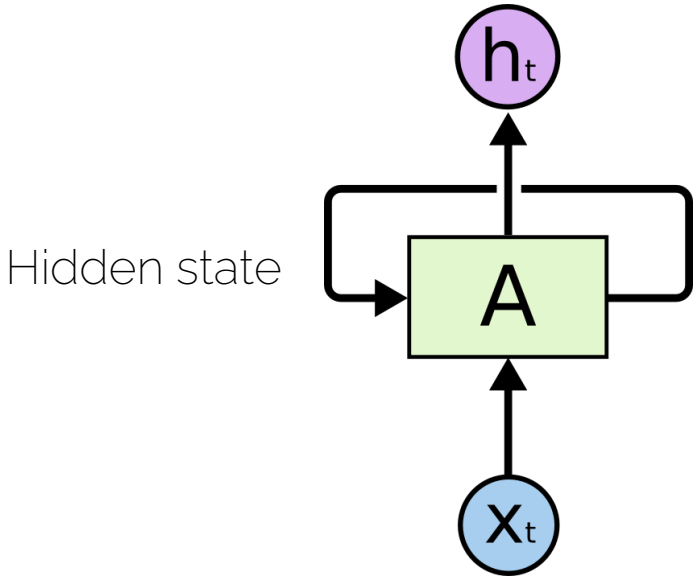
Representation Learning



[Chen et al., ICML'20] SimCLR, https://amitness.com/2020/03/illustrated-simclr/

Basic Structure of RNN

- We want to have notion of "time" or "sequence"



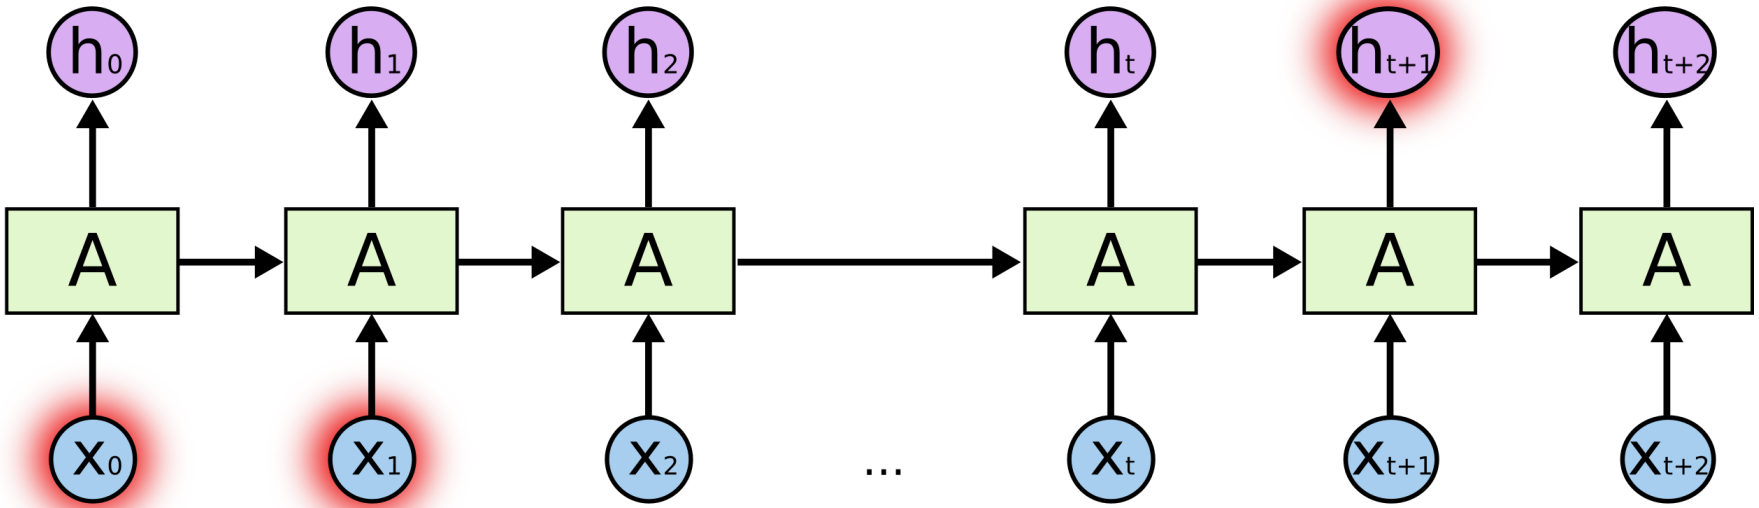
$$\boldsymbol{A_t = \theta_c A_{t-1} + \theta_x x_t}$$

Previous hidden state

Input

Source: https://colah.github.io/posts/2015-08-Understanding-LSTMs/

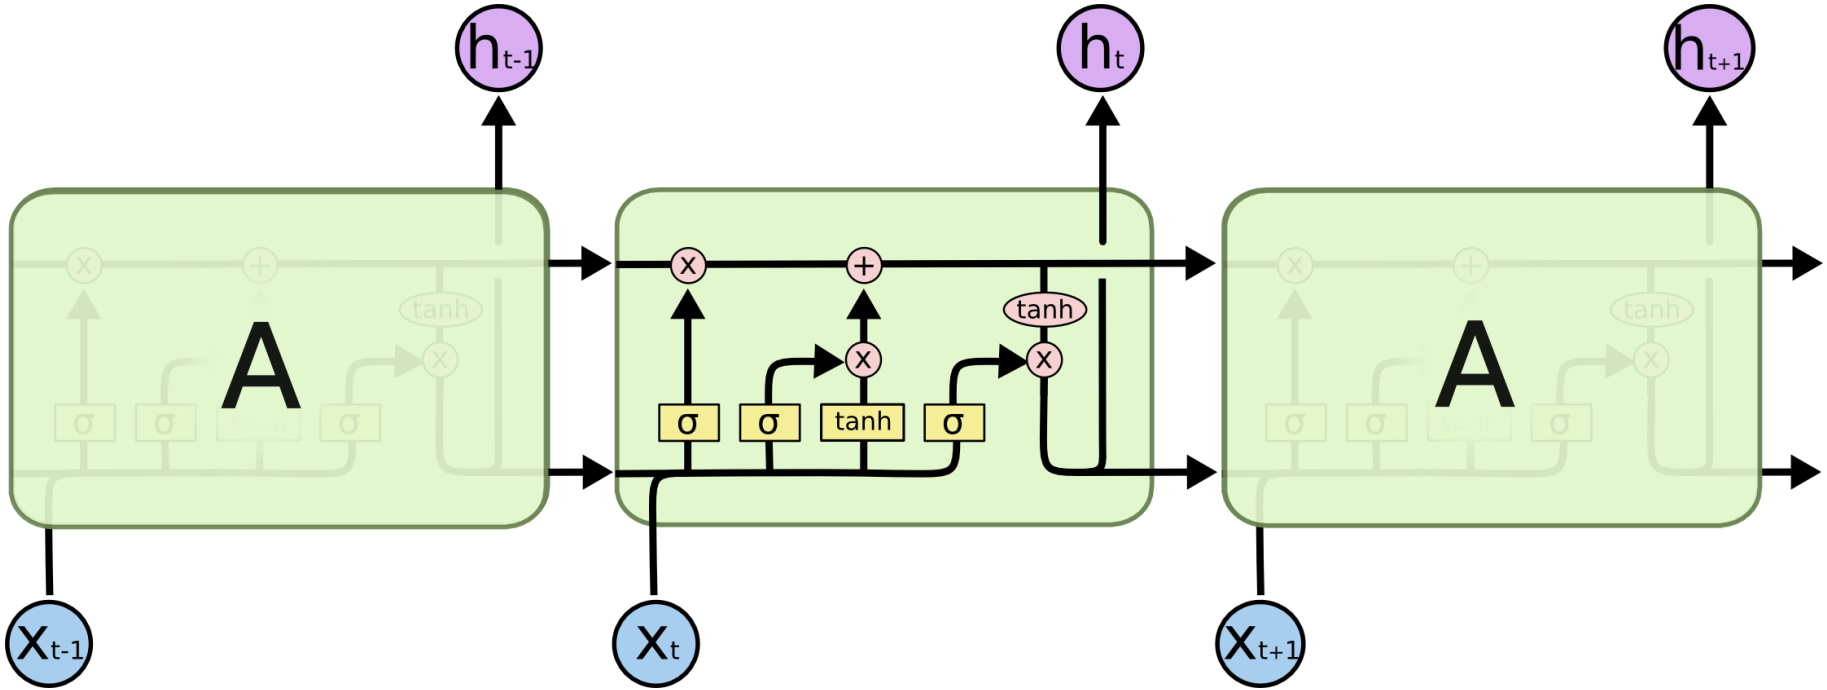
Long-Term Dependencies



I moved to Germany … so I speak German fluently.

Source: https://colah.github.io/posts/2015-08-Understanding-LSTMs/

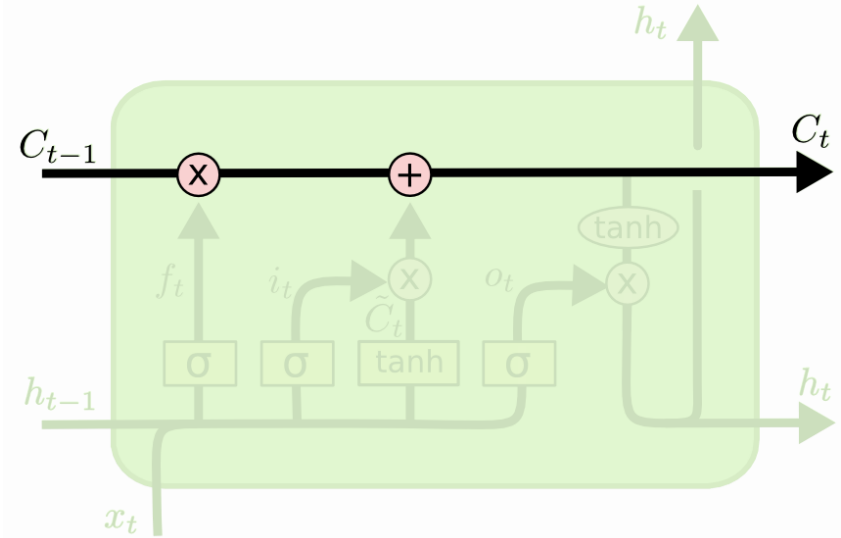
Long-Short Term Memory Units(LSTM)



Source: https://colah.github.io/posts/2015-08-Understanding-LSTMs/

Long-Short Term Memory Units

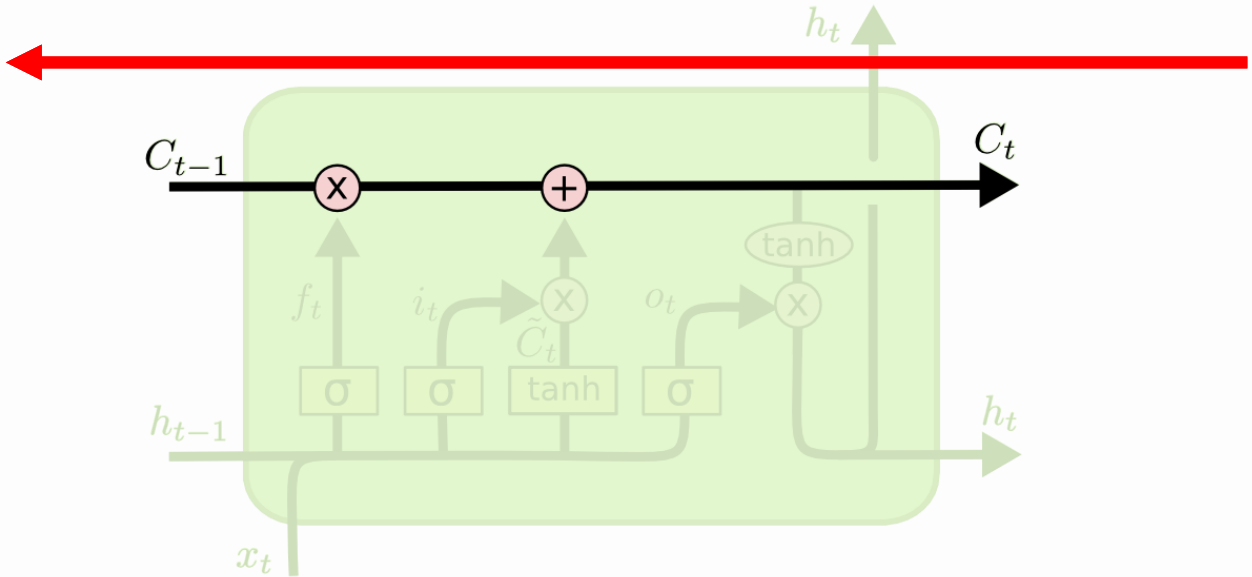
- Key ingredients
- Cell = transports the information through the unit



Source: https://colah.github.io/posts/2015-08-Understanding-LSTMs/

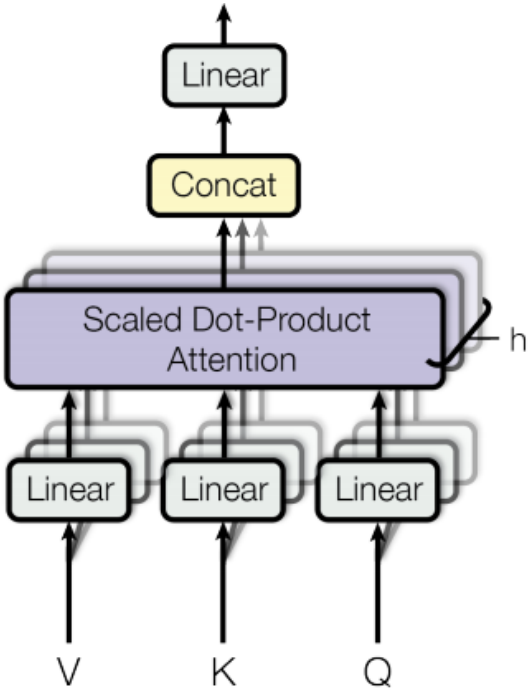
LSTM

- Highway for the gradient to flow



Source: https://colah.github.io/posts/2015-08-Understanding-LSTMs/

Attention

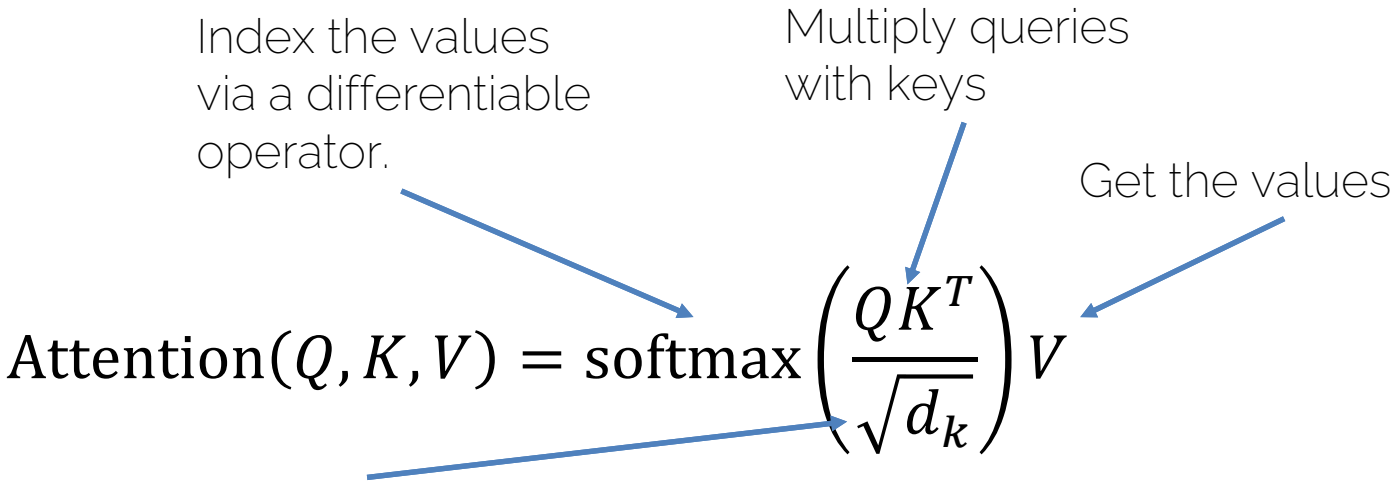


Intuition: Take the query Q, find the most similar key K, and then find the value V that corresponds to the key.

In other words, learn V, K, Q where:
V – here is a bunch of interesting things.
K – here is how we can index some things.
Q – I would like to know this interesting thing.

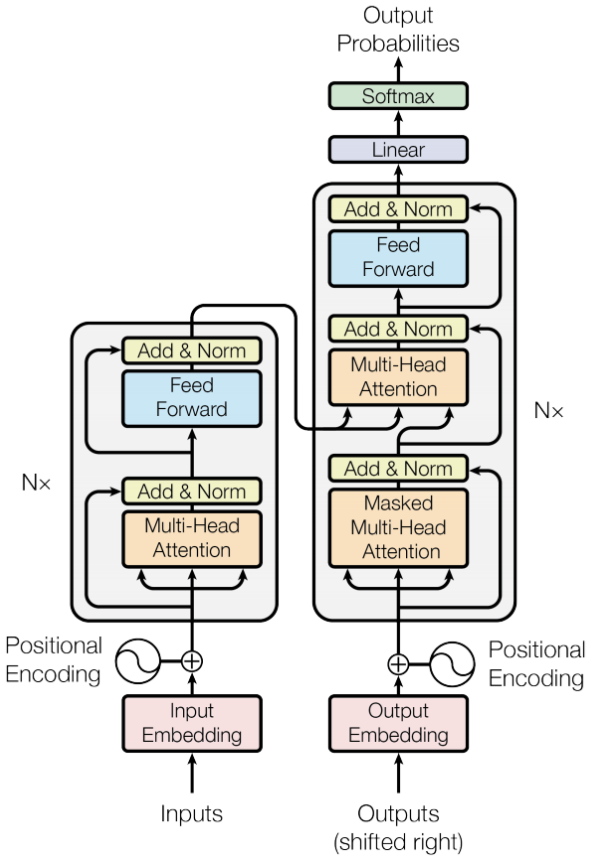
Loosely connected to Neural Turing Machines (Graves et al.).

Attention



To train them well, divide by $\sqrt{d_k}$, "probably" because for large values of the key's dimension, the dot product grows large in magnitude, pushing the softmax function into regions where it has extremely small gradients.

Transformers

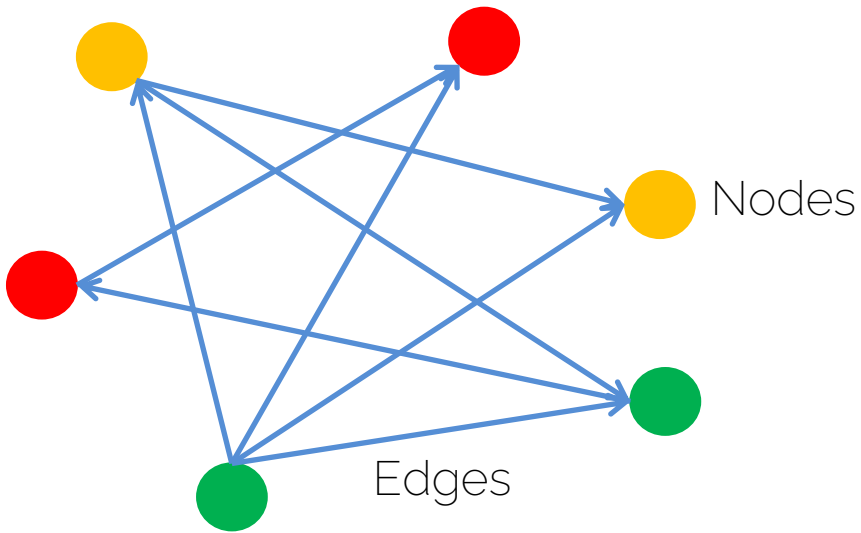


Lecture 12: Advanced DL topics

Graph Neural Networks

A graph

- Node: a concept
- Edge: a connection between concepts



Deep learning on graphs

- Generalizations of neural networks that can operate on graph-structured domains:
  - Scarselli et al. "The Graph Neural Network Model". IEEE Trans. Neur. Net 2009.
  - Kipf et al. "Semi-Supervised Classification with Graph Convolutional Networks. ICLR 2016.
  - Gilmer et al. "Neural Message Passing for Quantum Chemistry". ICML 2017
  - Battaglia et al. "Relational inductive biases, deep learning, and graph networks". arXiv 2018 (review paper)
- Key challenges:
  - Variable sized inputs (number of nodes and edges)
  - Need invariance to node permutations

General Idea

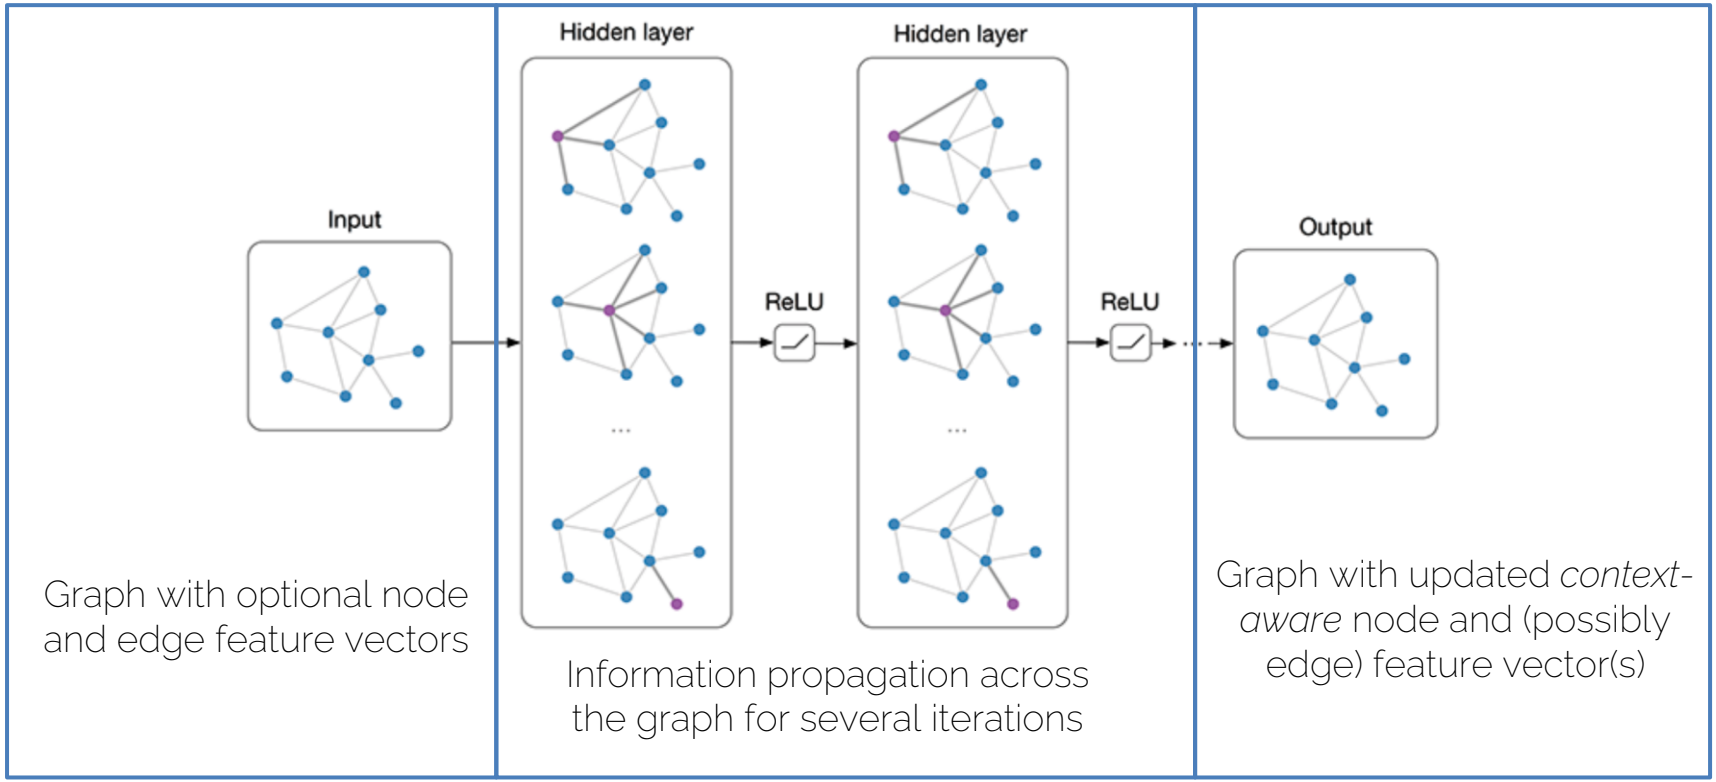


Figure credit: https://tkipf.github.io/graph-convolutional-networks/

General Idea

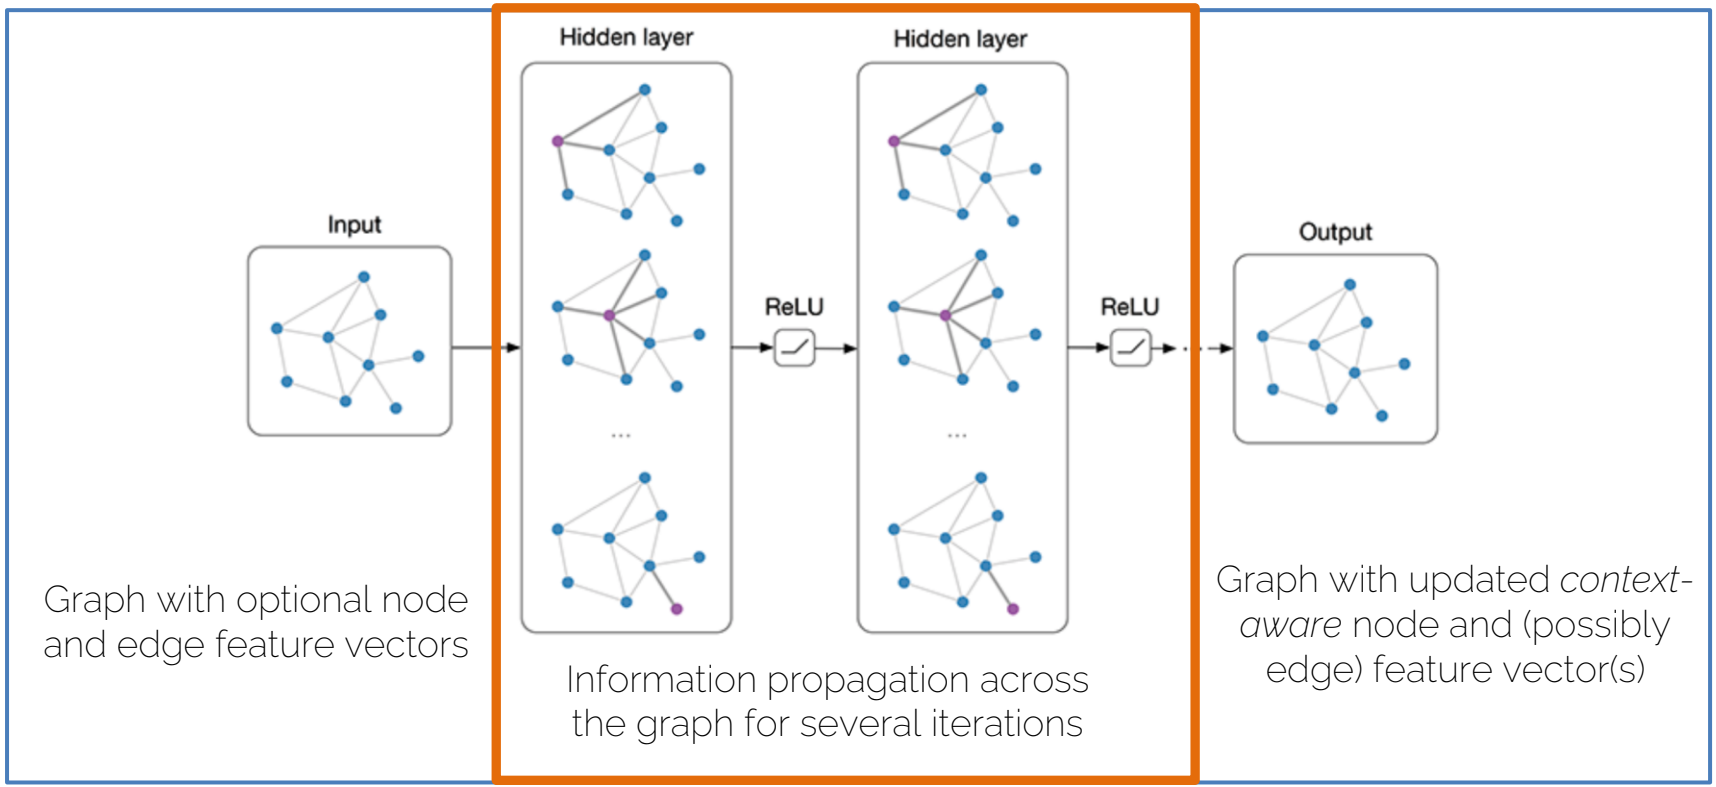

Figure credit: https://tkipf.github.io/graph-convolutional-networks/

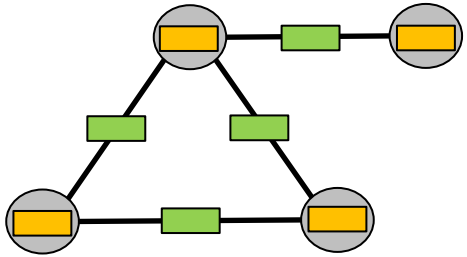
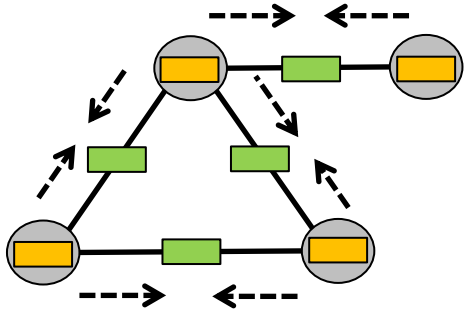
Message Passing Networks

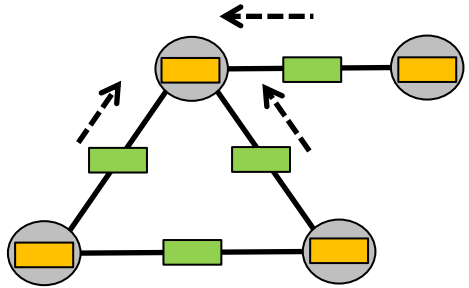
- We can divide the propagation process in two steps: 'node to edge' and 'edge to node' updates.



Initial Graph



'Node to Edge' Update



'Edge to Node' Update

Node embeddings
Edge embeddings

Battaglia et al. "Relational inductive biases, deep learning, and graph networks". 2018

‘Node to edge’ updates

- At every message passing step l, first do:

$$h_{(i,j)}^{(l)} = \mathcal{N}_e\left([h_i^{(l-1)}, h_{(i,j)}^{(l-1)}, h_j^{(l-1)}]\right)$$

Embedding of node i in the previous message passing step

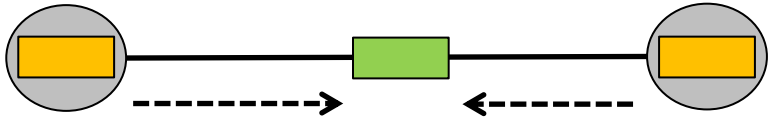
Embedding of edge (i,j) in the previous message passing step

Embedding of node j in the previous message passing step

‘Node to edge’ updates

- At every message passing step l, first do:

$$h_{(i,j)}^{(l)} = \mathcal{N}_e \left([h_i^{(l-1)}, h_{(i,j)}^{(l-1)}, h_j^{(l-1)}] \right)$$

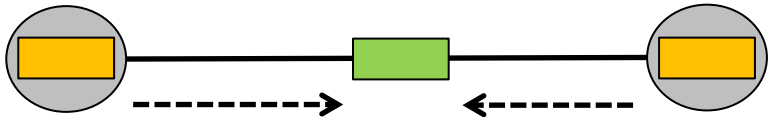


‘Node to edge’ updates

- At every message passing step l, first do:

$$h_{(i,j)}^{(l)} = \mathcal{N}_e \left([h_i^{(l-1)}, h_{(i,j)}^{(l-1)}, h_j^{(l-1)}] \right)$$

Learnable function (e.g. MLP) with shared weights across the entire graph



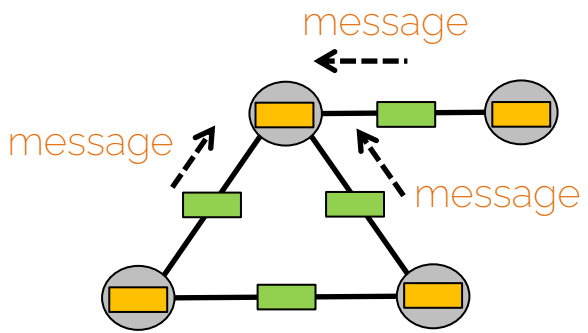
‘Edge to node’ updates

- After a round of edge updates, each edge embedding contains information about its pair of incident nodes
- Then, edge embeddings are used to update nodes:

$$m_i^{(l)} = \Phi\left(\left\{h_{(i,j)}^{(l)}\right\}_{j \in N_i}\right)$$

Order invariant operation (e.g. sum, mean, max)

Neighbors of node i



‘Edge to node’ updates

- After a round of edge updates, each edge embedding contains information about its pair of incident nodes
- Then, edge embeddings are used to update nodes:

$$m_i^{(l)} = \Phi\left(\left\{h_{(i,j)}^{(l)}\right\}_{j \in N_i}\right)$$

$$h_i^{(l)} = \mathcal{N}_v\left(\left[m_i^{(l)}, h_i^{(l-1)}\right]\right)$$

Learnable function (e.g. MLP) with shared weights across the entire graph

The aggregation provides each node embedding with contextual information about its neighbors

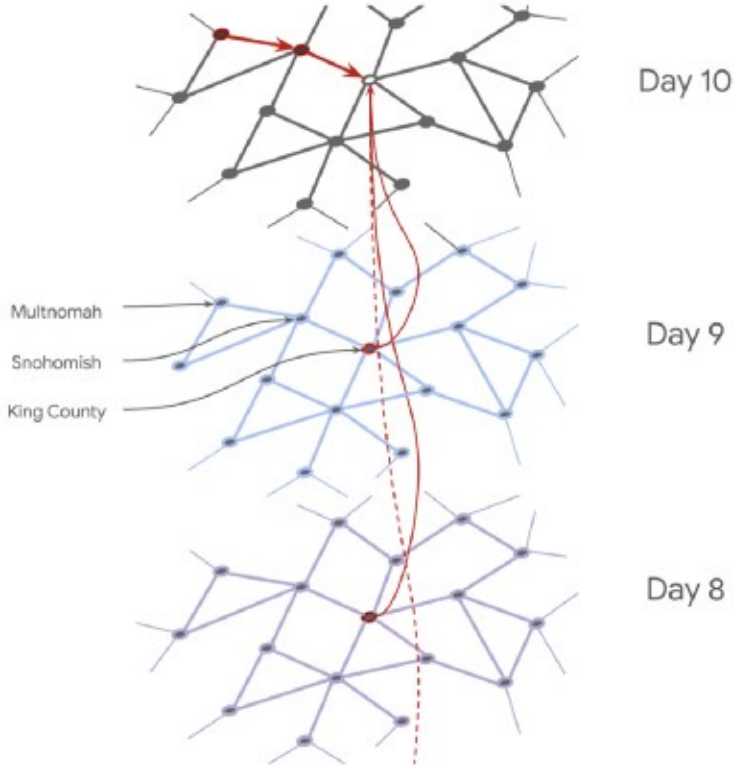
GNN Applications

- Node or edge classification
  - identifying anomalies such as spam, fraud
  - Relationship discovery for social networks, search networks

https://gm-neurips-2020.github.io/master-deck.pdf

GNN Applications

- Modeling epidemiology
  - Spatio-temporal graph



https://gm-neurips-2020.github.io/master-deck.pdf

GNN Applications

- Traffic forecasting

Generative Models

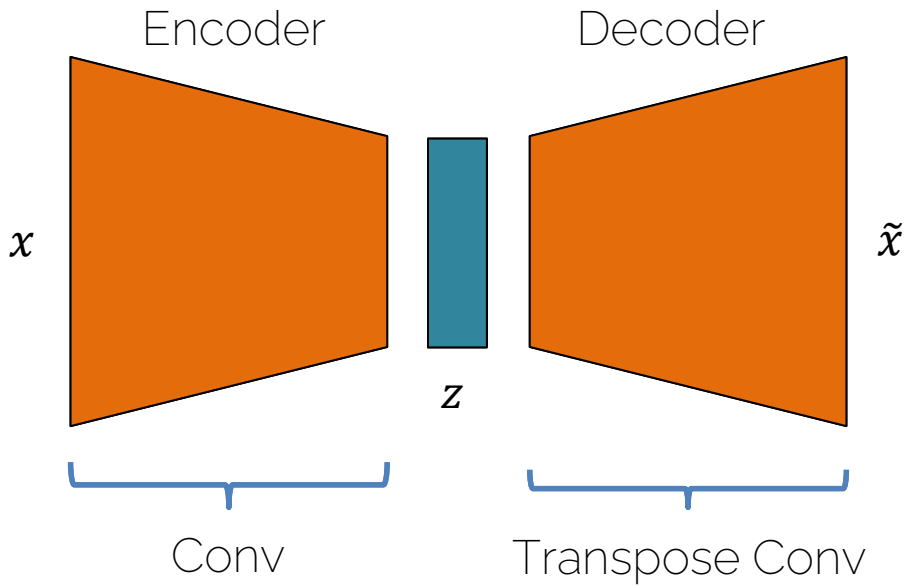
Figure copyright and adapted from Ian Goodfellow, Tutorial on Generative Adversarial Networks, 2017

Variational Autoencoders

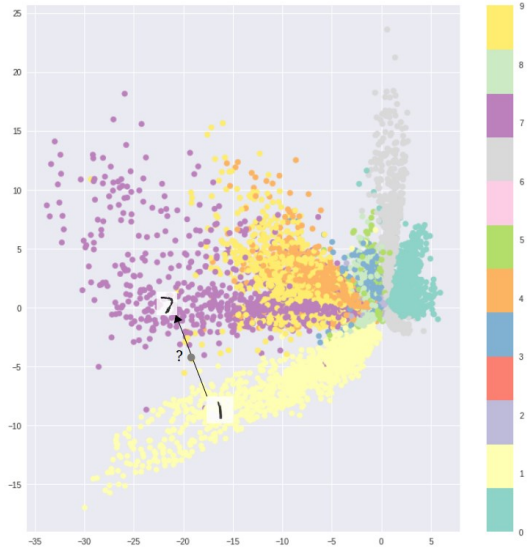
Autoencoders

- Encode the input into a representation (bottleneck) and reconstruct it with the decoder



Autoencoders

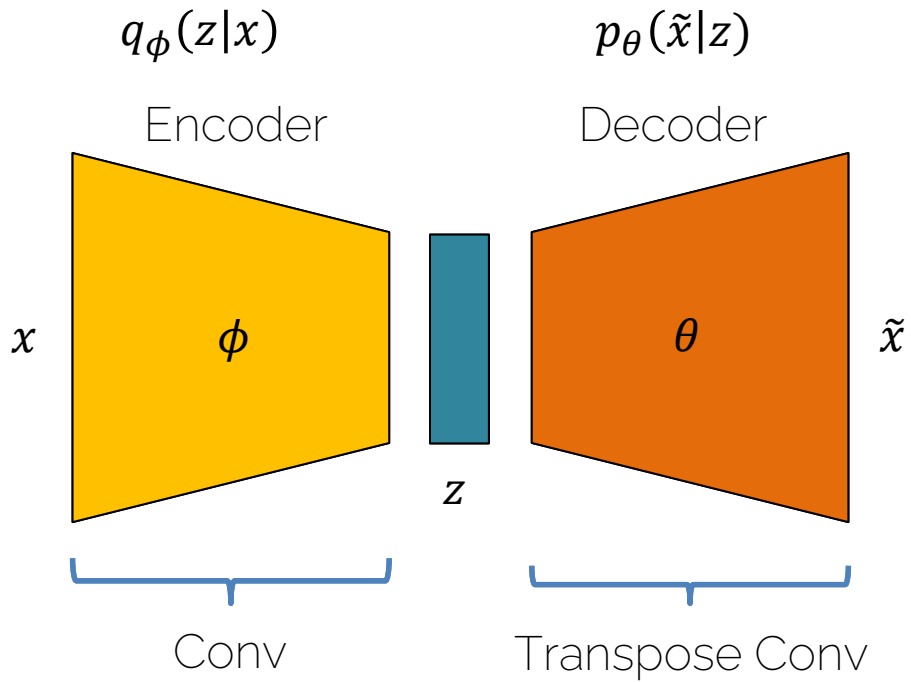
- Encode the input into a representation (bottleneck) and reconstruct it with the decoder



Latent space learned by autoencoder on MNIST

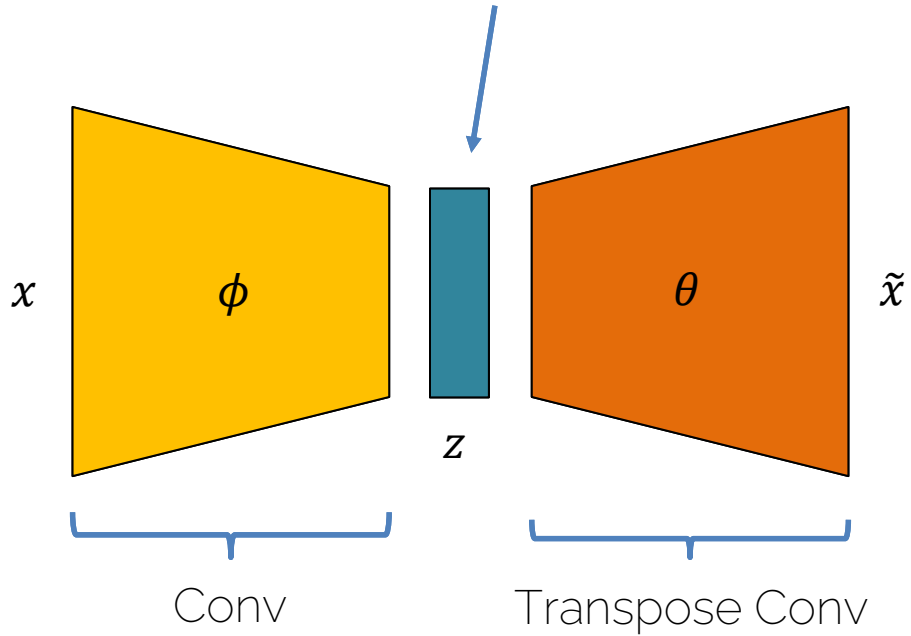
Source: https://bit.ly/37ctFMS

Variational Autoencoder



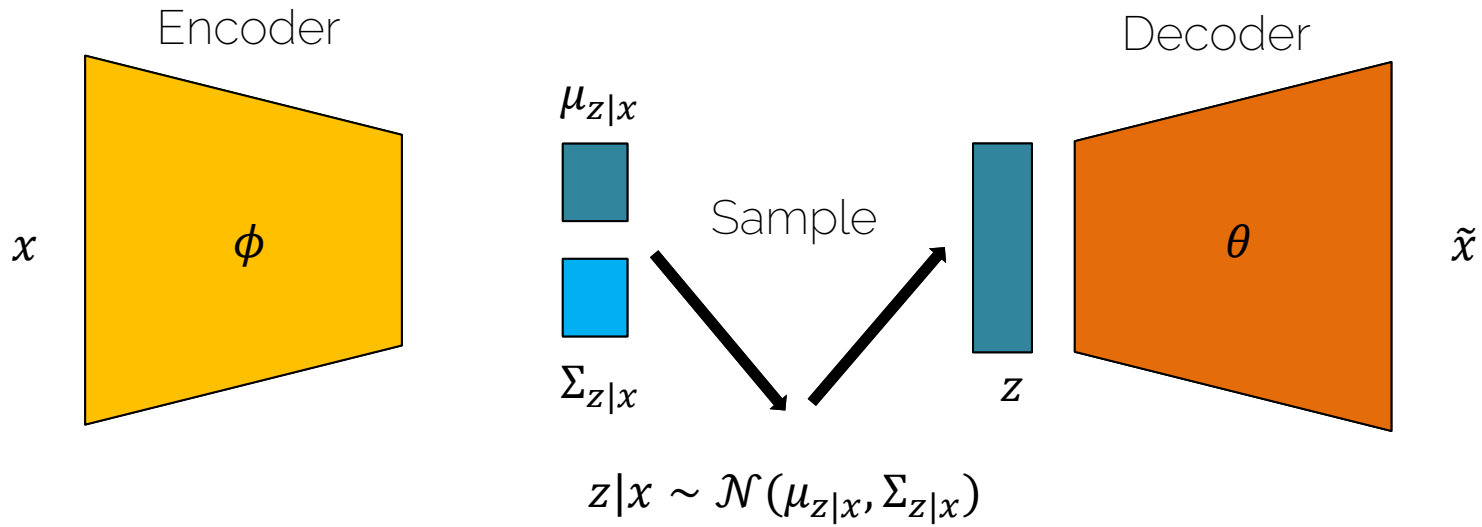
Variational Autoencoder

Goal: Sample from the latent distribution to generate new outputs!



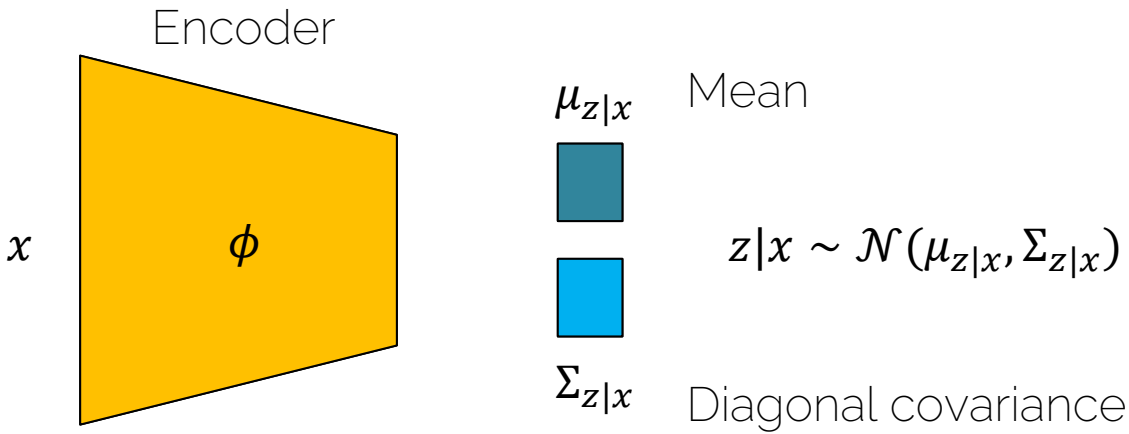
Variational Autoencoder

- Latent space is now a distribution
- Specifically it is a Gaussian



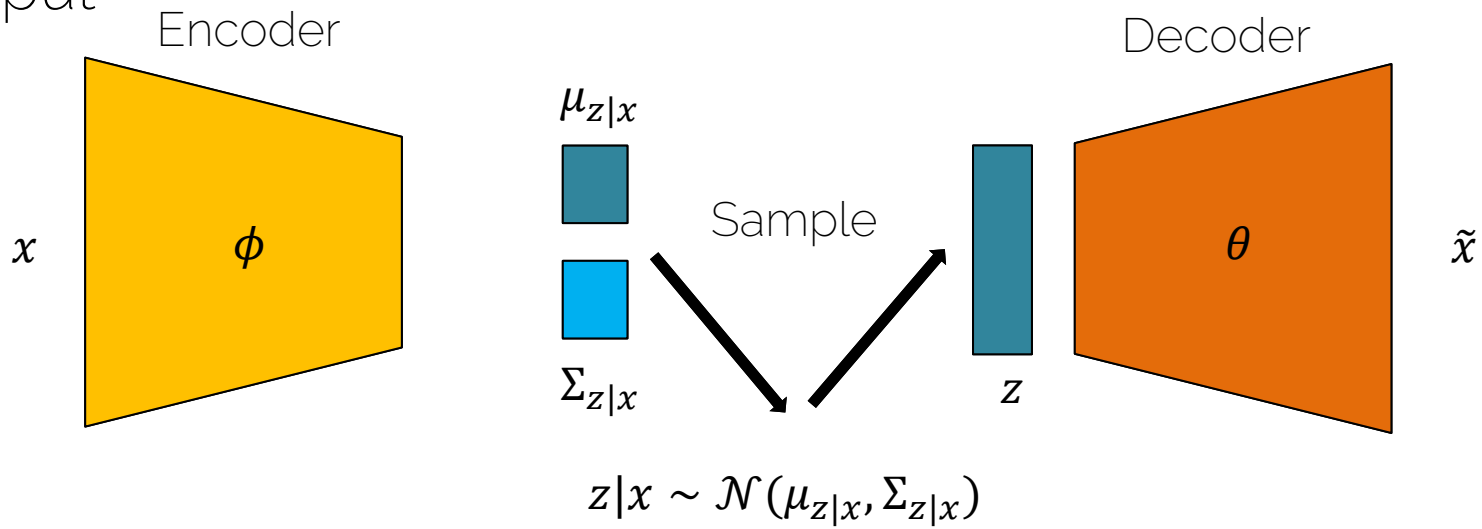
Variational Autoencoder

- Latent space is now a distribution
- Specifically it is a Gaussian



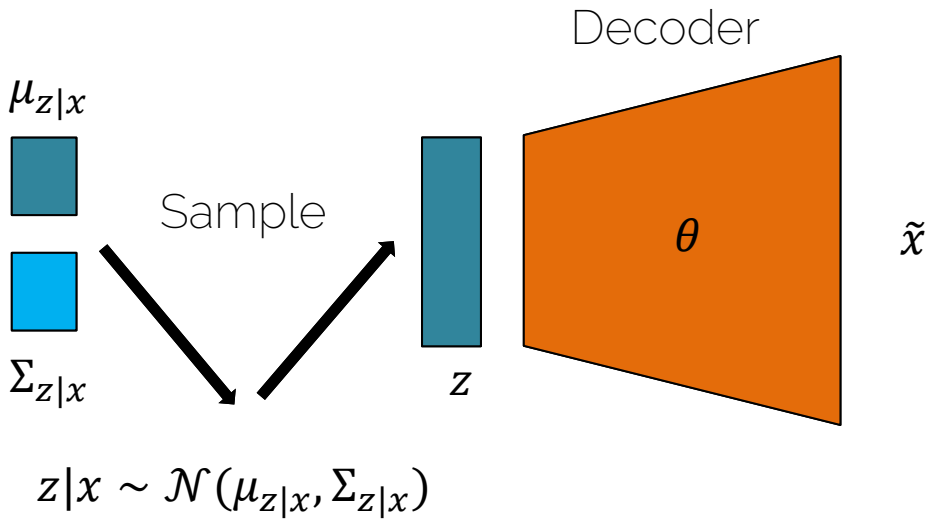
Variational Autoencoder

- Training: loss makes sure the latent space is close to a Gaussian and the reconstructed output is close to the input



Variational Autoencoder

- Test: Sample from the latent space



Autoencoder vs VAE

Autoencoder

Variational Autoencoder

Ground Truth

Source: https://github.com/kvfrans/variational-autoencoder

Generating data

Degree of smile

Head pose

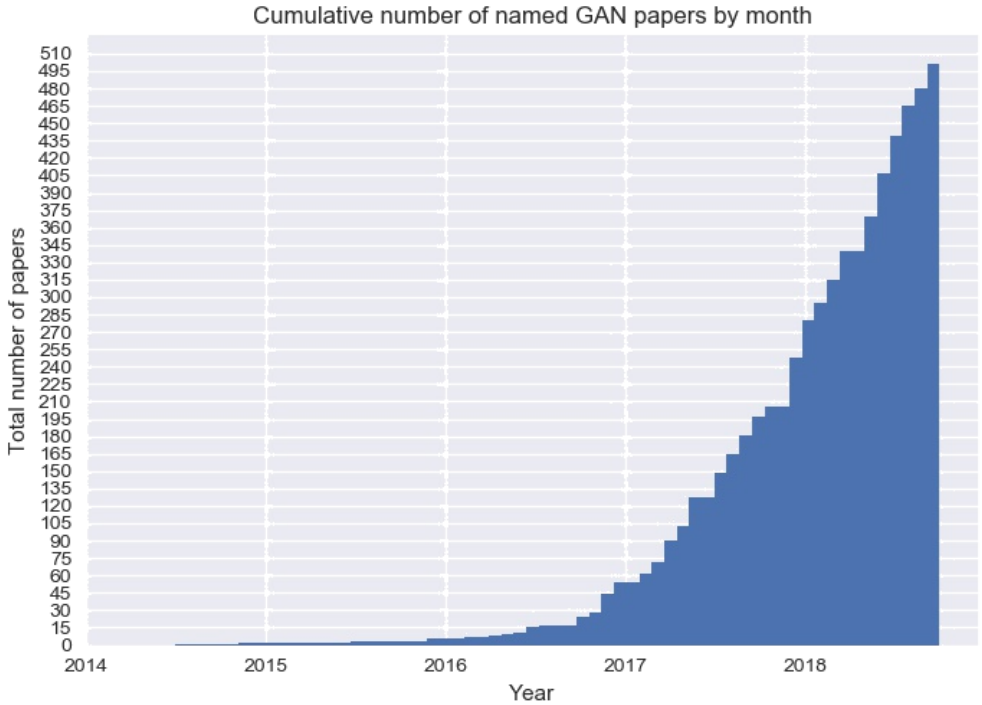
Autoencoder Overview

- Autoencoders (AE)
  - Reconstruct input
  - Unsupervised learning

- Variational Autoencoders (VAE)
  - Probability distribution in latent space (e.g., Gaussian)
  - Interpretable latent space (head pose, smile)
  - Sample from model to generate output

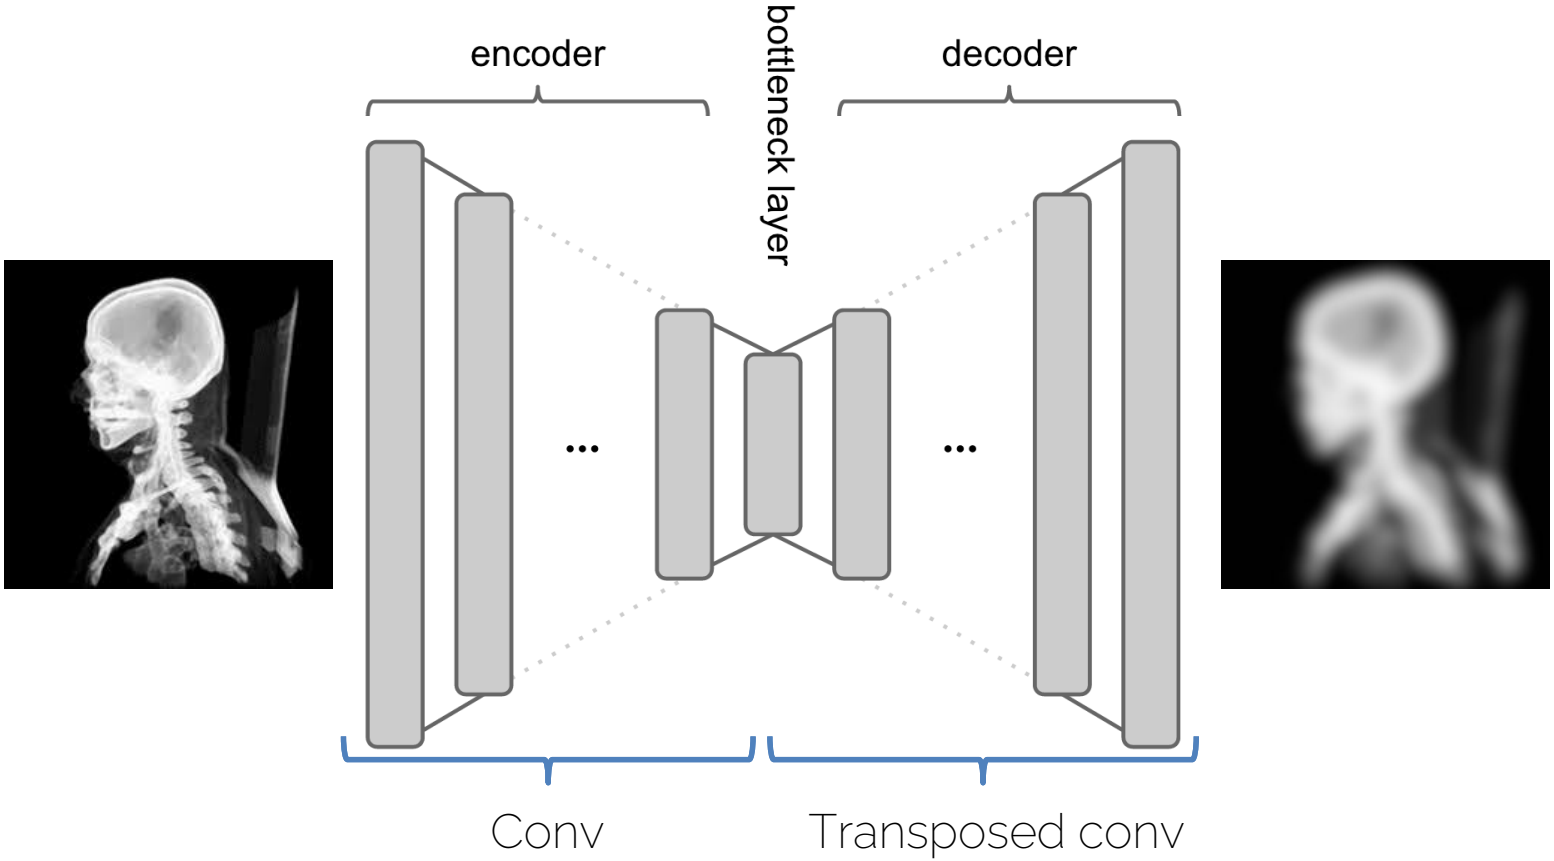
Generative Adversarial Networks (GANs)

Generative Adversarial Networks (GANs)



Source: https://github.com/hindupuravinash/the-gan-zoo

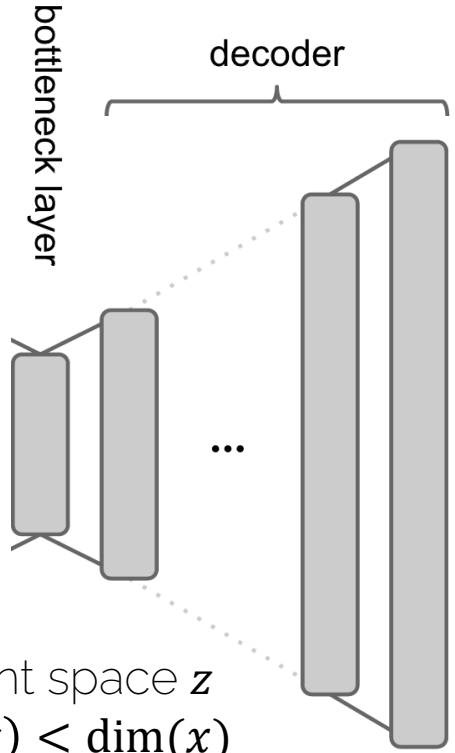
Autoencoder



Decoder as Generative Model

Test only use decoder

Test time:
-> reconstruction from 'random' vector

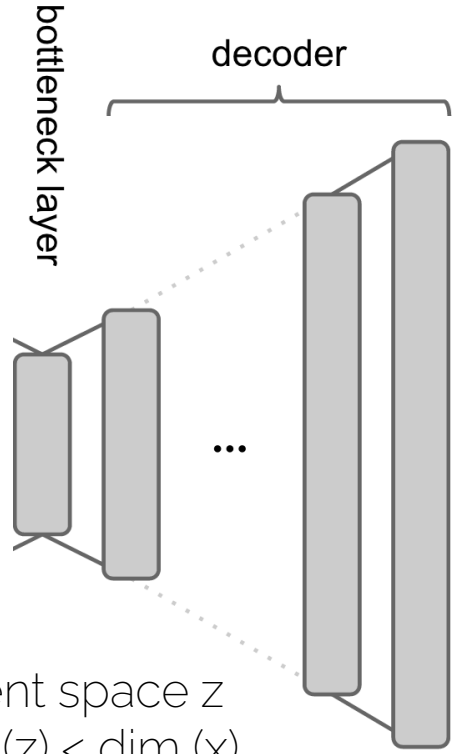


Latent space z
$\dim(z) < \dim(x)$

Reconstruction Loss (often L2)

Output Image

Decoder as Generative Model



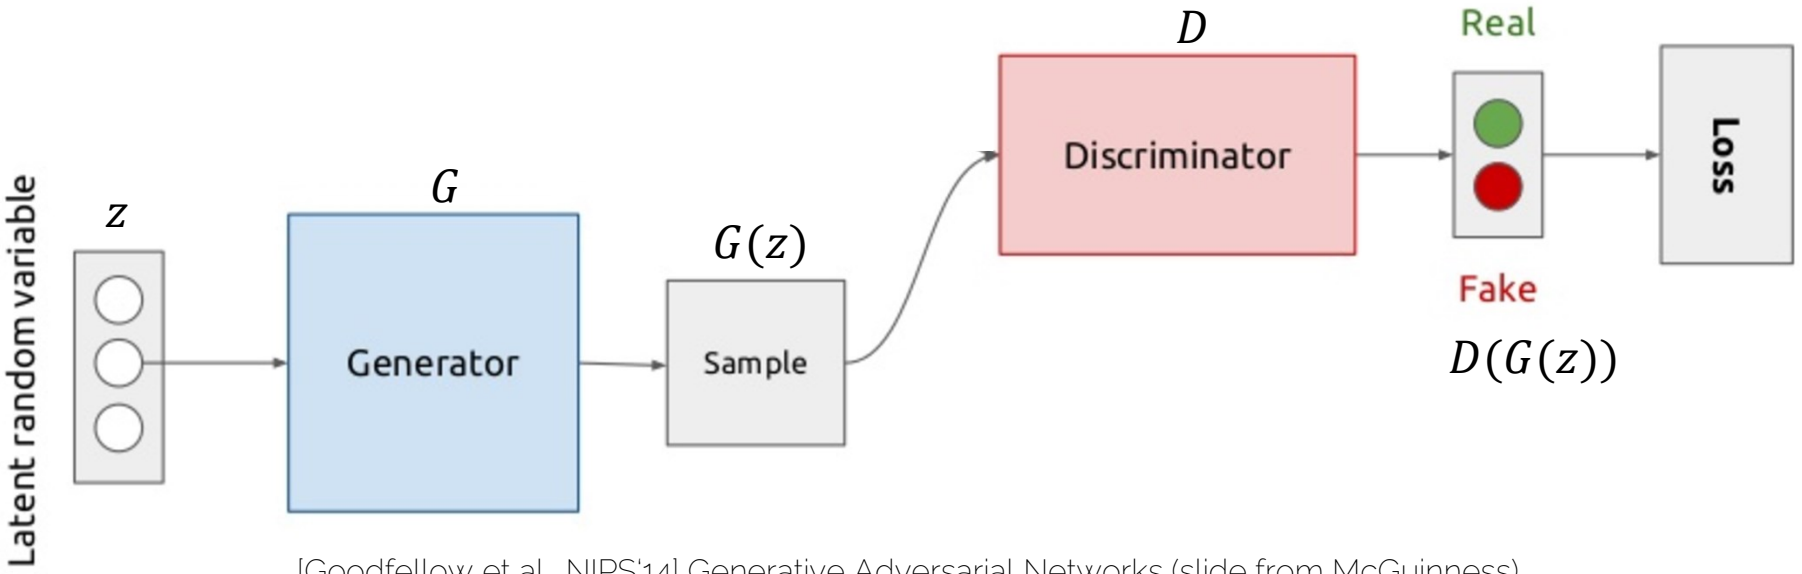
"Test time":
-> reconstruction from
'random' vector

Latent space z
dim (z) < dim (x)

Reconstruction Loss
Often L2, i.e., sum of squared dist.
-> L2 distributes error equally
-> mean is opt.
-> res. Is blurry

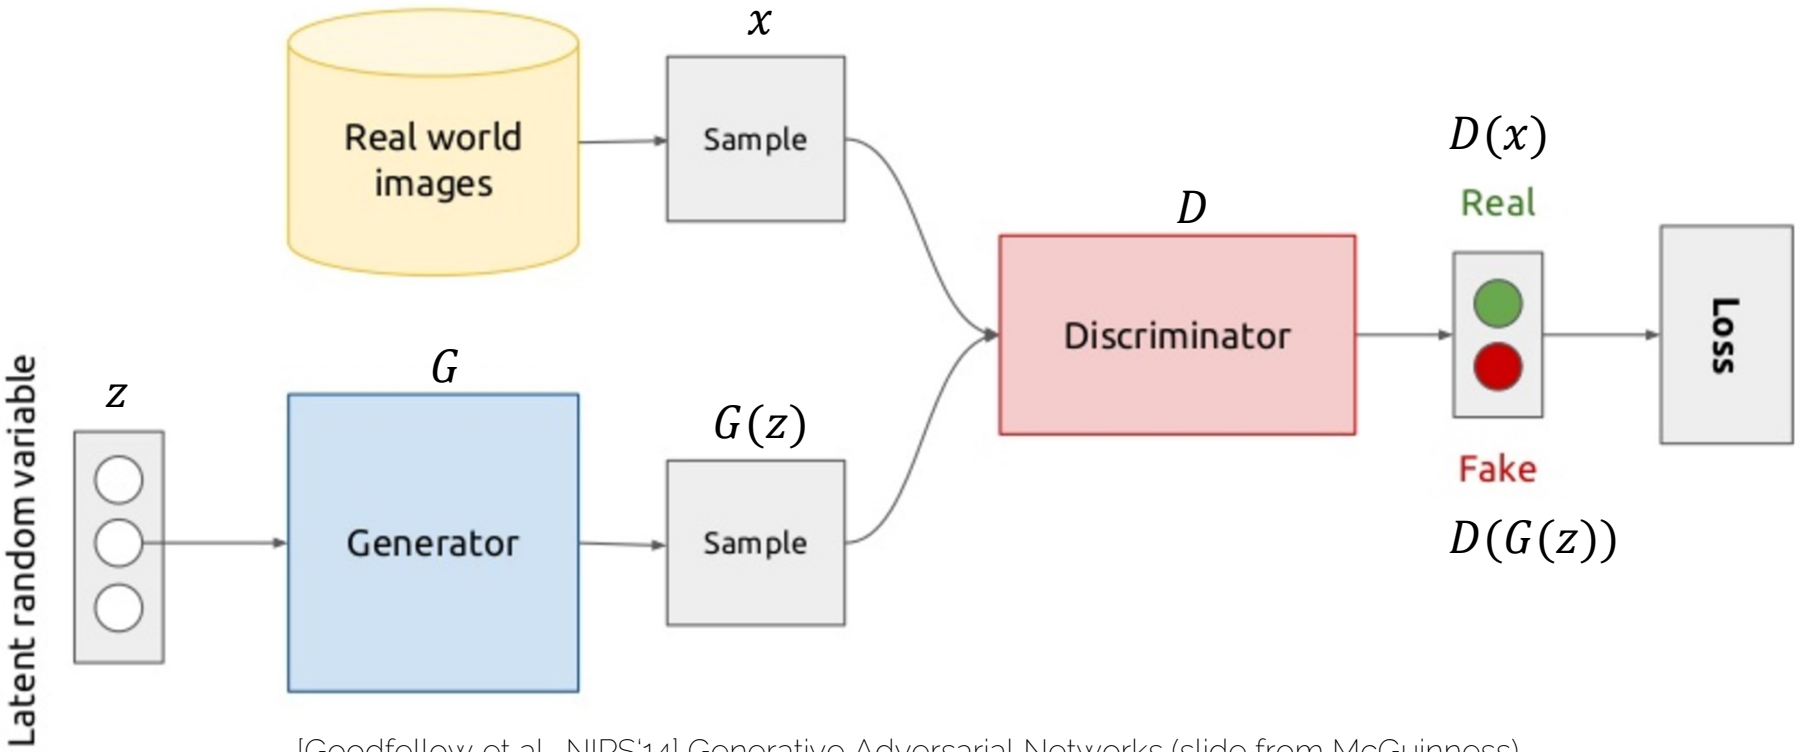
Instead of L2, can we "learn" a loss function?

Generative Adversarial Networks (GANs)



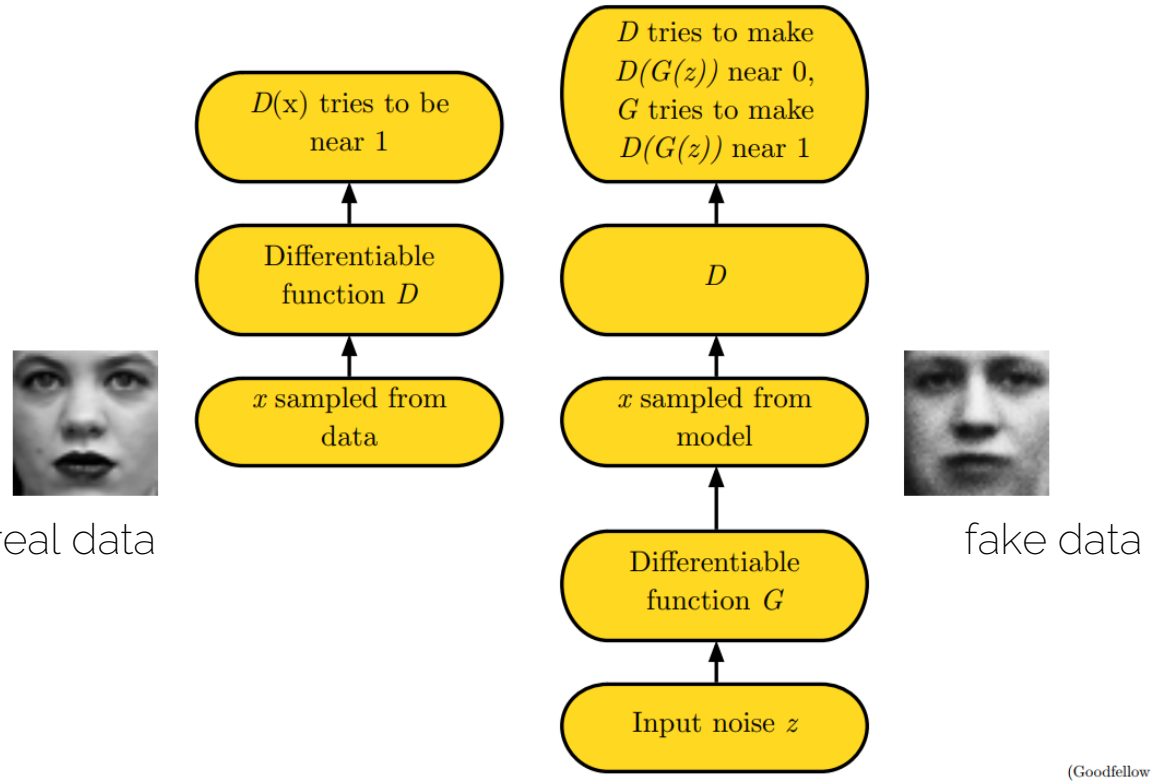
[Goodfellow et al., NIPS'14] Generative Adversarial Networks (slide from McGuinness)

Generative Adversarial Networks (GANs)



[Goodfellow et al., NIPS'14] Generative Adversarial Networks (slide from McGuinness)

Generative Adversarial Networks (GANs)



[Goodfellow, NIPS'16] Tutorial: Generative Adversarial Networks

GANs: Loss Functions

- Discriminator loss

$$J^{(D)} = \underbrace{-\frac{1}{2}\,\mathbb{E}_{\mathbf{x}\sim p_{data}} \log D(\boldsymbol{x}) - \frac{1}{2}\mathbb{E}_{\boldsymbol{z}} \log\Big(1 - D\big(G(\boldsymbol{z})\big)\Big)}_{\text{binary cross entropy}}$$

- Generator loss

$$J^{(G)} = -J^{(D)}$$

- Minimax Game:
  - G minimizes probability that D is correct
  - Equilibrium is saddle point of discriminator loss
    - D provides supervision (i.e., gradients) for G

[Goodfellow et al., NIPS'14] Generative Adversarial Networks

GAN Applications

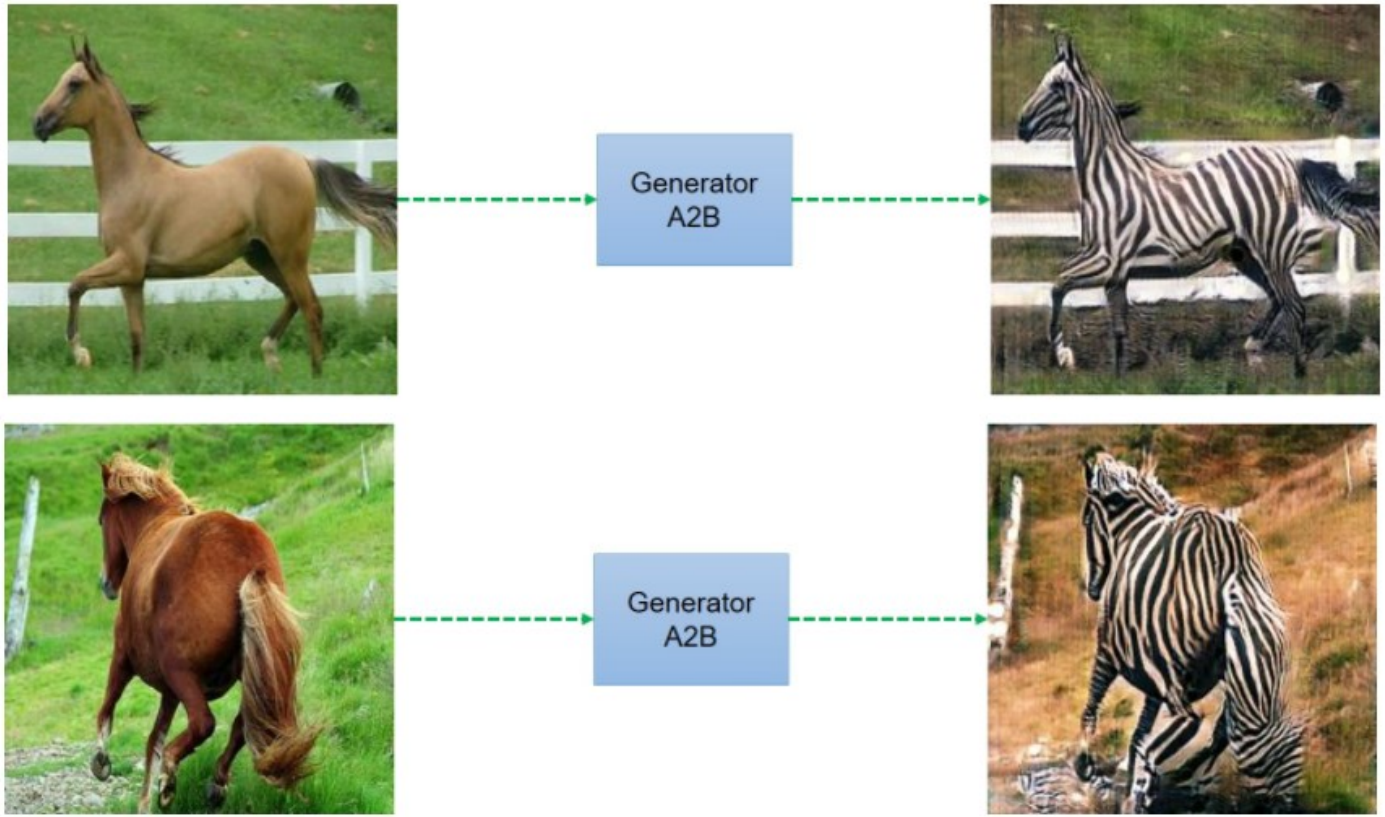
BigGAN: HD Image Generation

[Brock et al., ICLR'18] BigGAN : Large Scale GAN Training for High Fidelity Natural Image Synthesis

StyleGAN: Face Image Generation

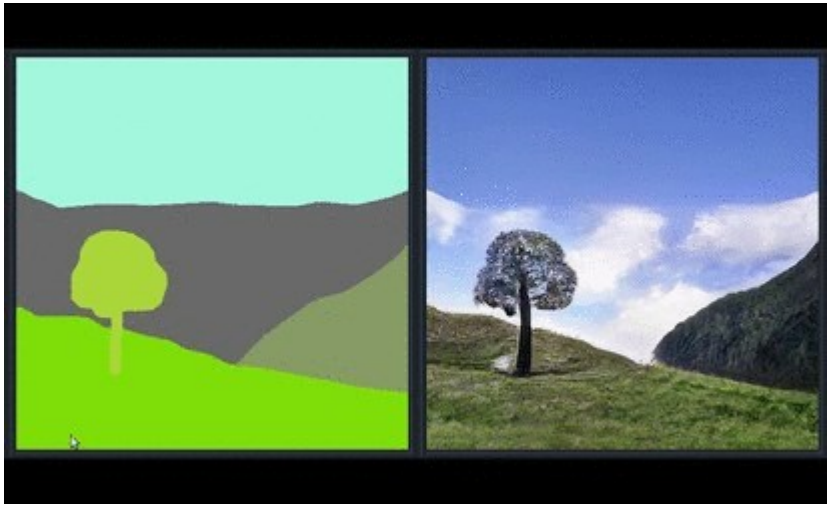
[Karras et al., '18] StyleGAN : A Style-Based Generator Architecture for Generative Adversarial Networks
[Karras et al., '19] StyleGAN2 : Analyzing and Improving the Image Quality of StyleGAN

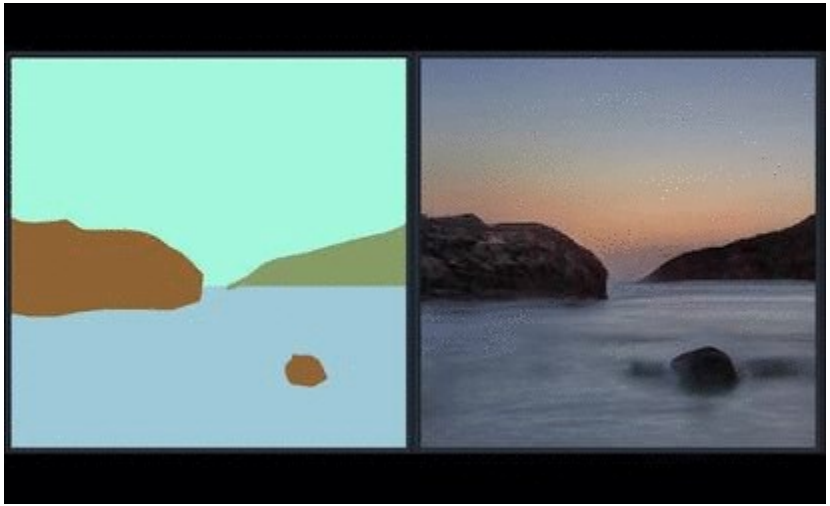
Cycle GAN: Unpaired Image-to-Image Translation



[Zhu et al., ICCV'17] Cycle GAN : Unpaired Image-to-Image Translation using Cycle-Consistent Adversarial Networks

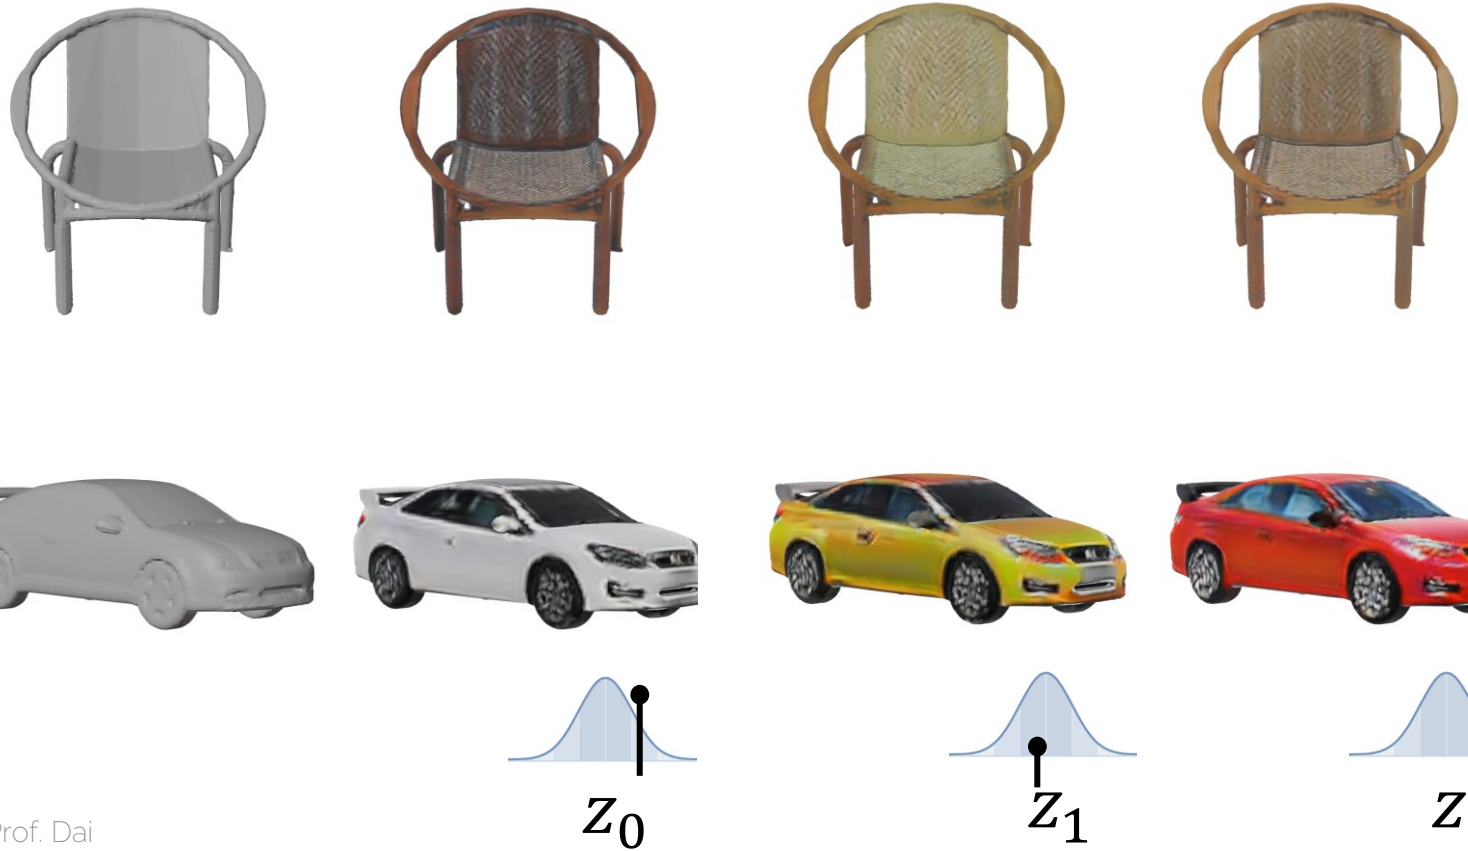
SPADE: GAN-Based Image Editing





[Park et al., CVPR'19] SPADE : Semantic Image Synthesis with Spatially-Adaptive Normalization

Texturify: 3D Texture Generation



Diffusion

Diffusion – Search Interest

Source: Google Trends

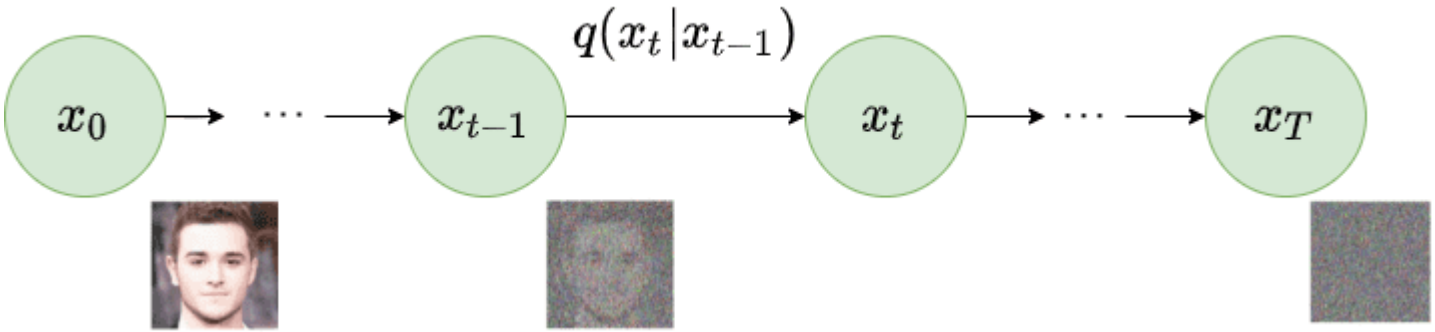
Diffusion Models

- Class of generative models
- Achieved state-of-the-art image generation (DALLE-2, Imagen, StableDiffusion)
- What is diffusion?

Diffusion Process

- Gradually add noise to input image $\boldsymbol{x_0}$ in a series of $\boldsymbol{T}$ time steps

- Neural network trained to recover original data



[Ho et al. '20] Denoising Diffusion Probabilistic Models

Forward Diffusion

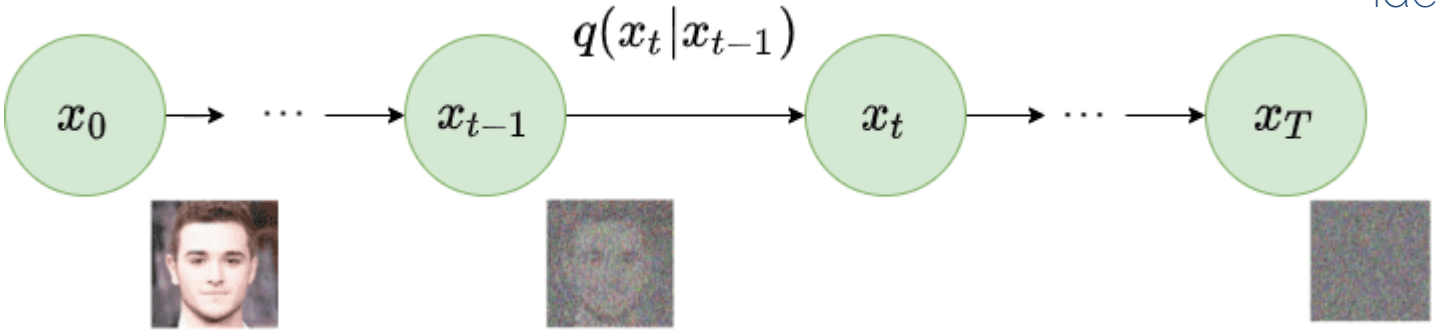
- Markov chain of T steps
  - Each step depends only on previous
- Adds noise to x_0 sampled from real distribution $q(x)$

$$q(x_t|x_{t-1}) = \mathcal{N}(x_t; \boldsymbol{\mu}_t = \sqrt{1-\beta_t}x_{t-1}, \boldsymbol{\Sigma}_t = \beta_t \mathbf{I})$$

mean

variance

identity matrix



[Ho et al. '20] Denoising Diffusion Probabilistic Models

Forward Diffusion

- Go from $\boldsymbol{x_0}$ to $\boldsymbol{x_T}$:

$$q(x_{1:T}|x_0) = \prod_{t=1}^{T} q(x_t|x_{t-1})$$

- Efficiency?

Reparameterization

- Define $\alpha_t = 1 - \beta_t,\ \overline{\alpha_t} = \prod_{s=0}^{t} \alpha_s\ ,\ \epsilon_0, \dots, \epsilon_{t-1} \sim \mathcal{N}(\mathbf{0}, \mathbf{I})$

$$
\begin{aligned}
x_t &= \sqrt{1-\beta_t} x_{t-1} + \sqrt{\beta_t}\epsilon_{t-1} \\
&= \sqrt{\alpha_t} x_{t-2} + \sqrt{1-\alpha_t}\epsilon_{t-2} \\
&= \dots \\
&= \sqrt{\overline{\alpha_t}} x_0 + \sqrt{1-\overline{\alpha_t}}\epsilon_0
\end{aligned}
$$

$$
x_t \sim q(x_t|x_0) = \mathcal{N}(x_t; \sqrt{\overline{\alpha_t}} x_0, (1-\overline{\alpha_t})\mathbf{I})
$$

Reverse Diffusion

- $x_{T \to \infty}$ becomes a Gaussian distribution

- Reverse distribution $q(x_{t-1}|x_t)$
  - Sample $x_T \sim \mathcal{N}(\mathbf{0}, \mathbf{I})$ and run reverse process
  - Generates a novel data point from original distribution

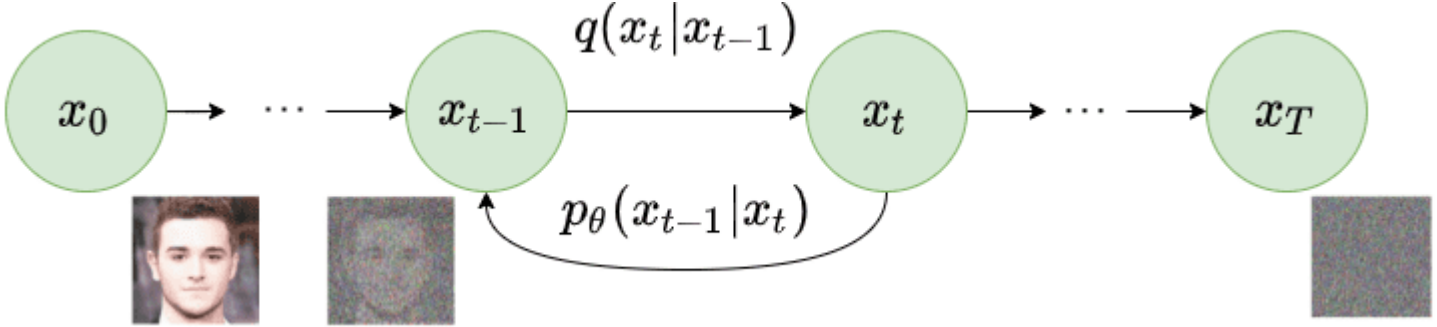
- How to model reverse process?

Approximate Reverse Process

- Approximate $q(x_{t-1}|x_t)$ with parameterized model p_θ (e.g., deep network)

$$p_\theta(x_{t-1}|x_t) = \mathcal{N}(x_{t-1}; \mu_\theta(x_t, t), \Sigma_\theta(x_t, t))$$

$$p_\theta(x_{0:T}) = p_\theta(x_T) \prod_{t=1}^{T} p_\theta(x_{t-1}|x_t)$$



[Ho et al. '20] Denoising Diffusion Probabilistic Models

Training a Diffusion Model

- Optimize negative log-likelihood of training data

$$L_{VLB} = \mathbb{E}_q[\underbrace{D_{KL}(q(x_T|x_0||p_\theta(x_T))}_{L_T} + \sum_{t=2}^{T} \underbrace{D_{KL}\big(q(x_{t-1}|x_t, x_0)||p_\theta(x_{t-1}|x_t)\big)}_{L_{t-1}} \underbrace{- \log p_\theta(x_0|x_1)}_{L_0}]$$

- Nice derivations: https://lilianweng.github.io/posts/2021-07-11-diffusion-models

Training a Diffusion Model

- $L_{t-1} = D_{KL}\big(q(x_{t-1}|x_t, x_0)||p_\theta(x_{t-1}|x_t)\big)$
- Comparing two Gaussian distributions
- $L_{t-1} \propto \|\tilde{\mu}_t(x_t, x_0) - \mu_\theta(x_t, t)\|^2$

- Predicts diffusion posterior mean

Diffusion Model Architecture

- Input and output dimensions must match
- Highly flexible to architecture design
- Commonly implemented with U-Net architectures

Applications for Diffusion Models

- Text-to-image

Oil Painting

Digital Illustration

Hyperrealistic

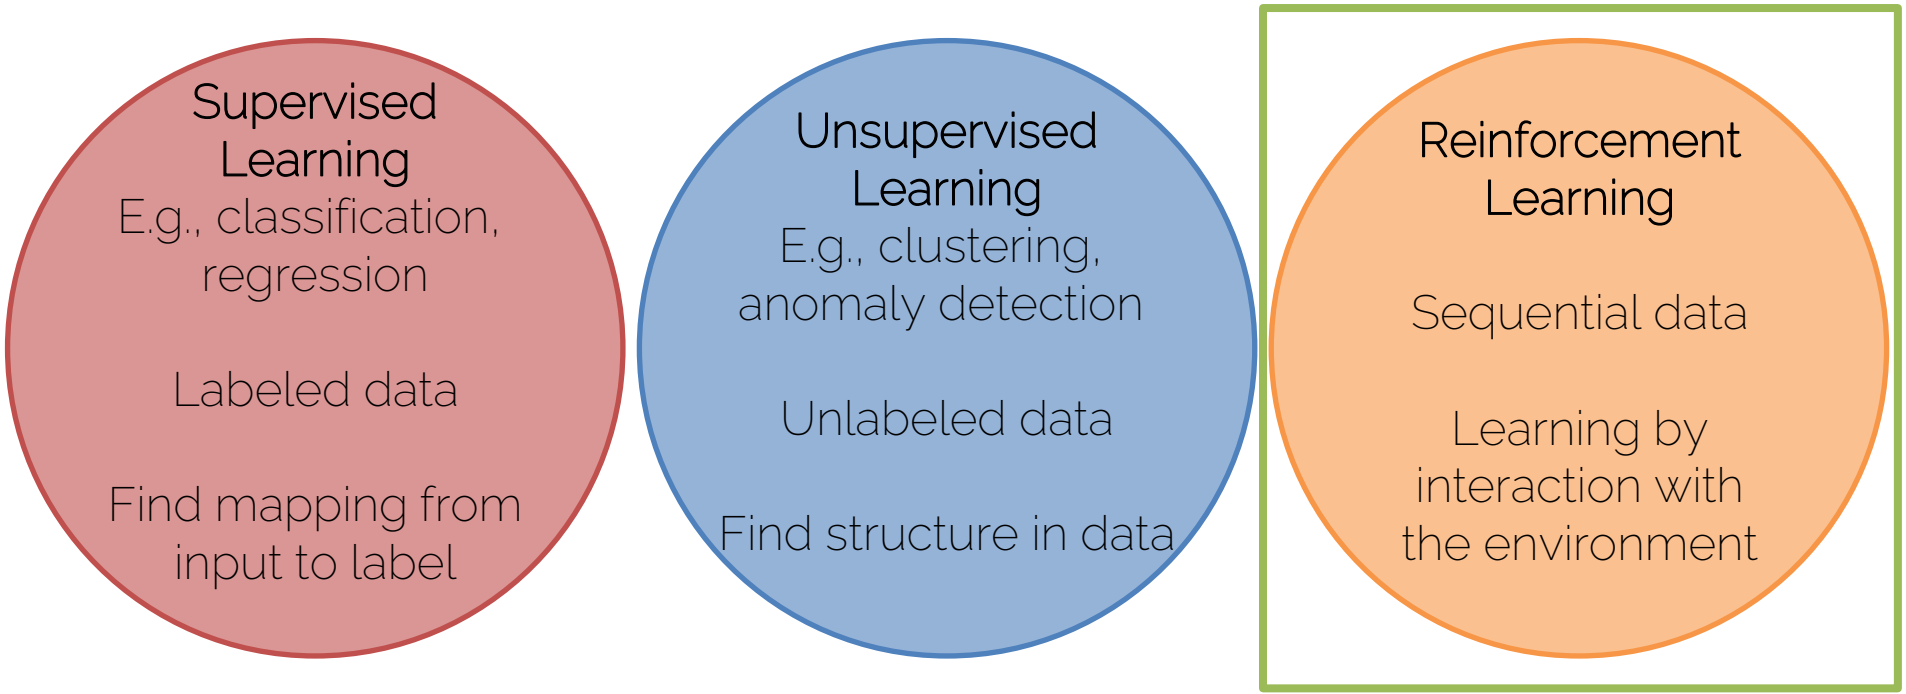
Reinforcement Learning

Learning Paradigms in ML



In a Nutshell

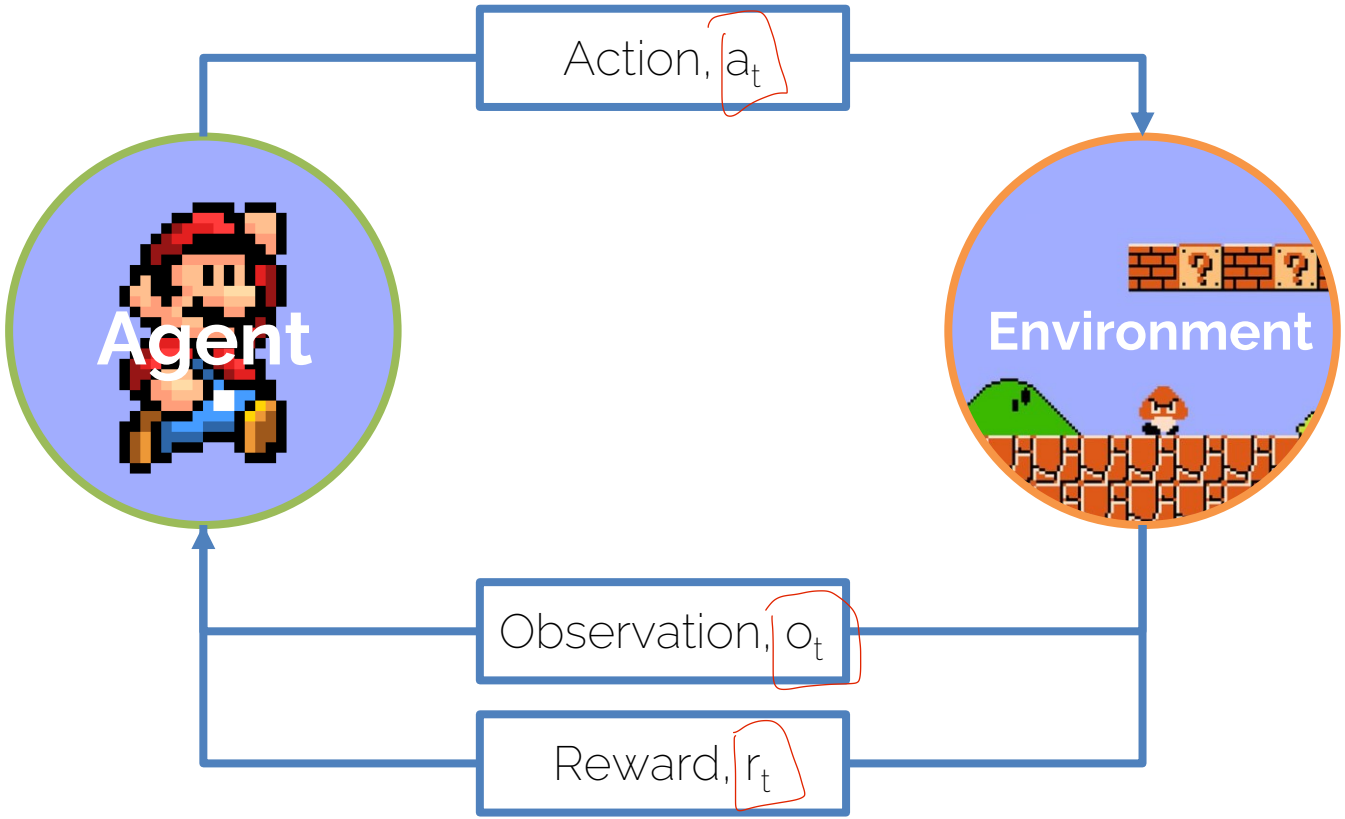
- RL-agent is trained using the "carrot and stick" approach
- Good behavior is encouraged by rewards
- Bad behavior is discouraged by punishment

Source: quora.com

Examples of RL: Learning to Walk

Source: Deepmind.com

Agent and Environment



Characteristics of RL

- Sequential, non i.i.d. data (time matters)
- Actions have an effect on the environment
  -> Change future input
- No supervisor, target is approximated by the reward signal

History and State

- The agent makes decisions based on the **history h** of observations, actions and rewards up to time-step t

$$h_t = o_1, a_1, r_1, \dots, a_{t-1}, r_{t-1}, o_t$$

- The **state s** contains all the necessary information from **h** -> **s** is a function of **h**

$$s_t = f(h_t)$$

Source: UCL Reinforcement Learning

Markov Assumption

- Problem: History grows linearly over time
- Solution: Markov Assumption
- A state S_t is Markov if and only if:

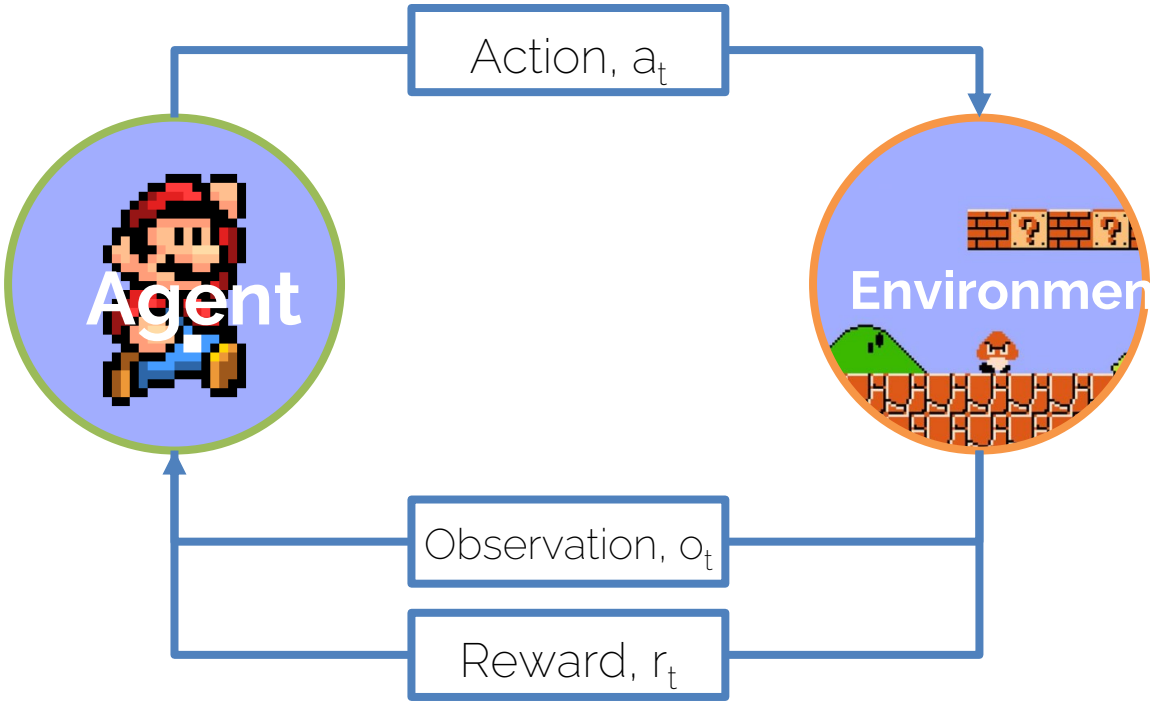
$$\mathbb{P}[s_{t+1}|s_t] = \mathbb{P}[s_{t+1}|s_1, \dots s_t]$$

- "The future is independent of the past given the present"

Source: UCL Reinforcement Learning

Agent and Environment

- Reward and next state are functions of current observation o_t and action a_t only



Mathematical Formulation

- The RL problem is a Markov Decision Process (MDP) defined by: $(\mathcal{S}, \mathcal{A}, \mathcal{R}, \mathbb{P}, \gamma)$

$\mathcal{S}$: Set of possible states
$\mathcal{A}$: Set of possible actions
$\mathcal{R}$: Distribution of reward given (state, action) pair
$\mathbb{P}$: Transition probability of a (state, action) pair
γ : Discount factor (discounts future rewards)

Source: Stanford cs231n

Components of an RL Agent

- Policy π : Behavior of the agent
  -> Mapping from state to action: $a = \pi(s)$

- Value-, Q-Function: How good is a state or (state, action) pair
  -> Expected future reward

Source: UCL Reinforcement Learning

Taxonomy of RL Algorithms

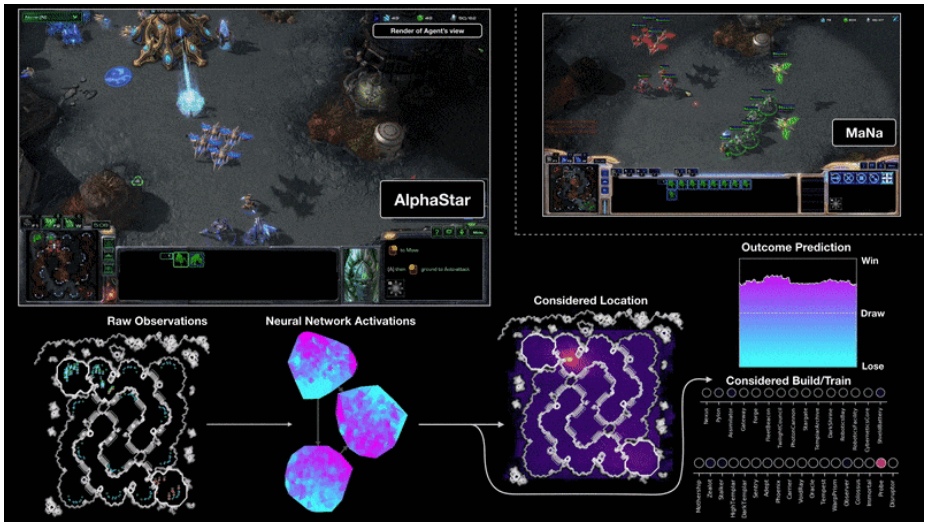
RL Milestones: Playing Atari

- Mnih et al. 2013, first appearance of DQN
- Successfully learned to play different Atari games like Pong, Breakout, Space Invaders, Seaquest and Beam Rider

[Mnih et al., NIPS'13] Playing Atari with Deep Reinforcement Learning

RL Milestones: AlphaZero (StarCraft)

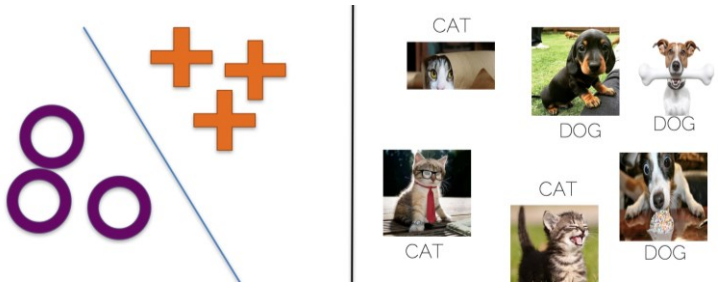
- Model: Transformer network with a LSTM core
- Trained on 200 years of StarCraft play for 14 days
- 16 Google v3 TPUs
- December 2018:
  Beats MaNa, a professional StarCraft player (world rank 13)



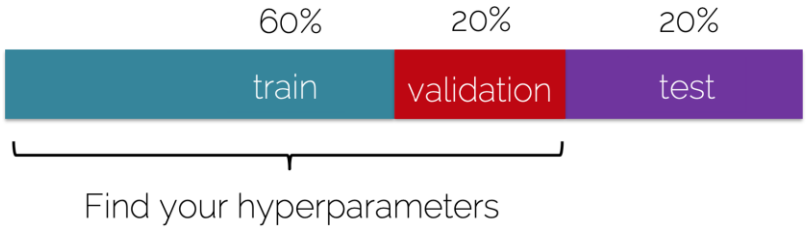
I2DL Overview

Machine Learning Basics

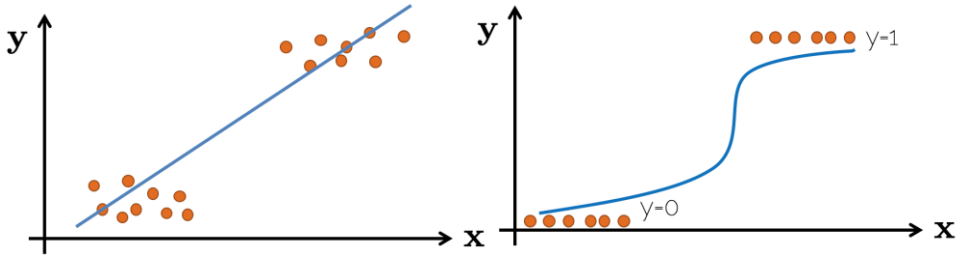
- Unsupervised vs Supervised Learning



- Data splitting

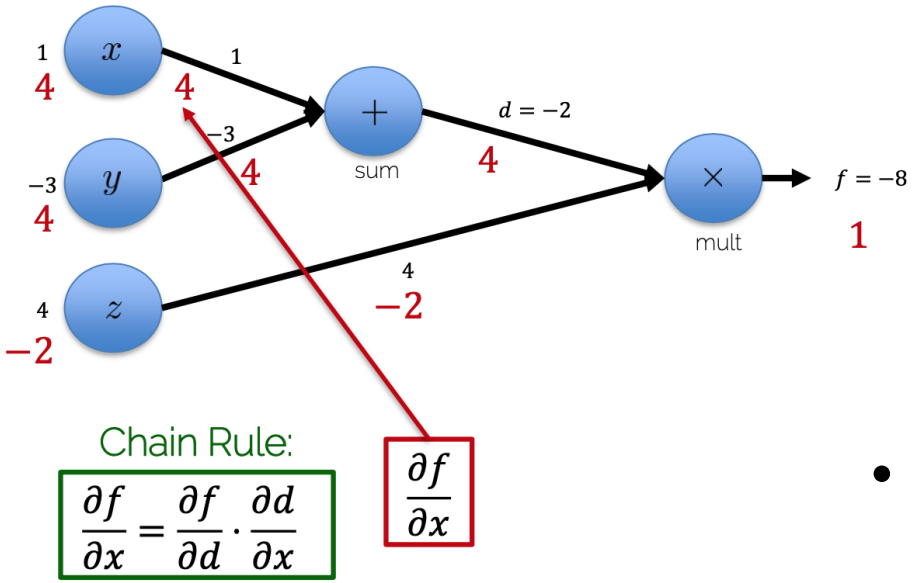


- Linear vs logistic regression

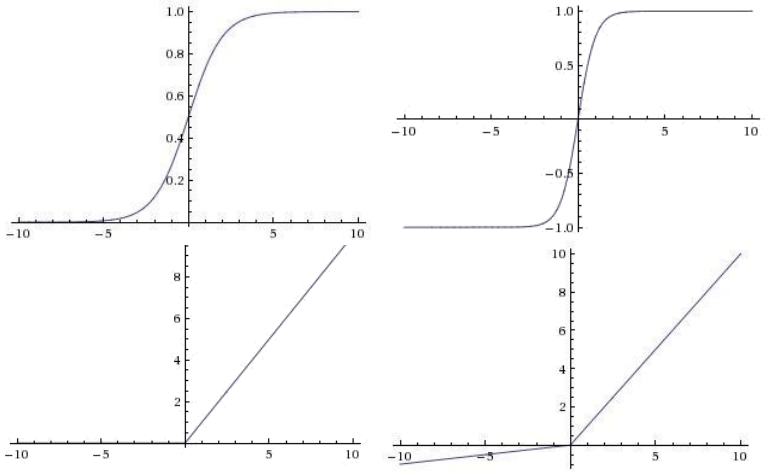


Intro to Neural Networks

- Backpropagation



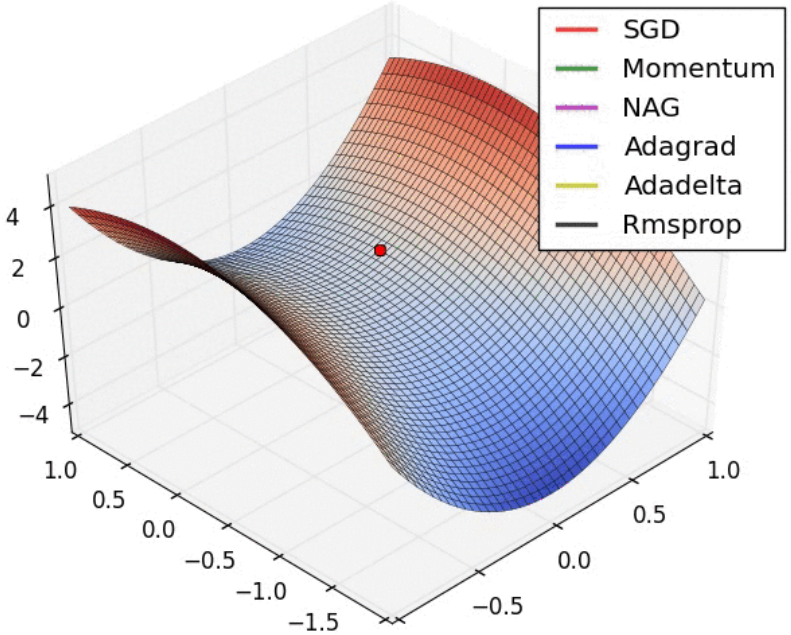
- Activation functions



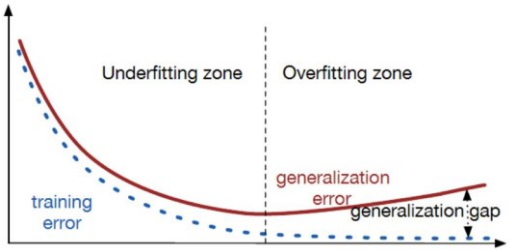
- Loss functions
  - Comparison & effects

Training Neural Networks

- Gradient Descent/ SGD



- Regularization



- Parameter & interpre

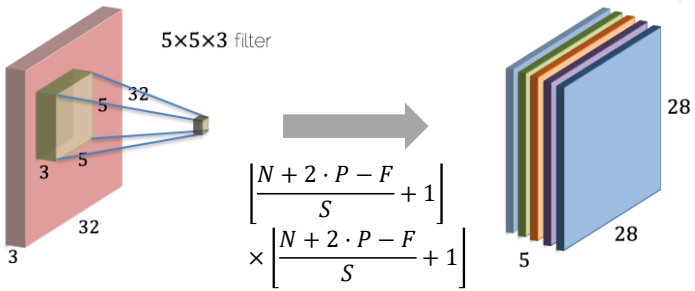
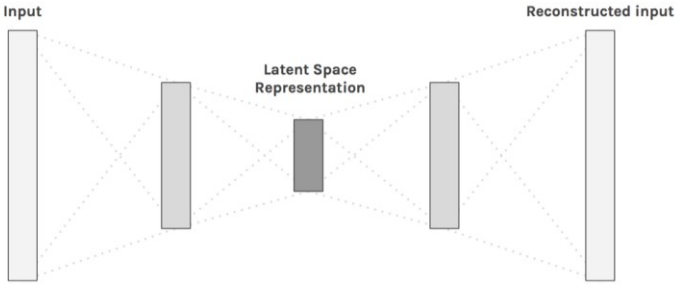
Typology of Neural Networks

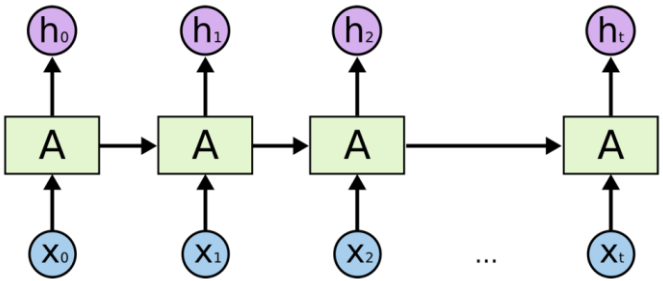
- CNNs



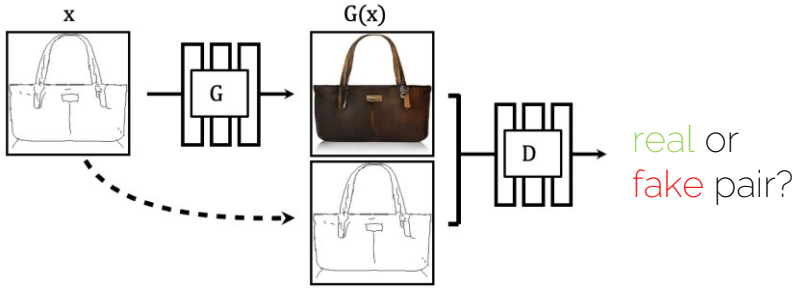
- Autoencoder



- RNNs

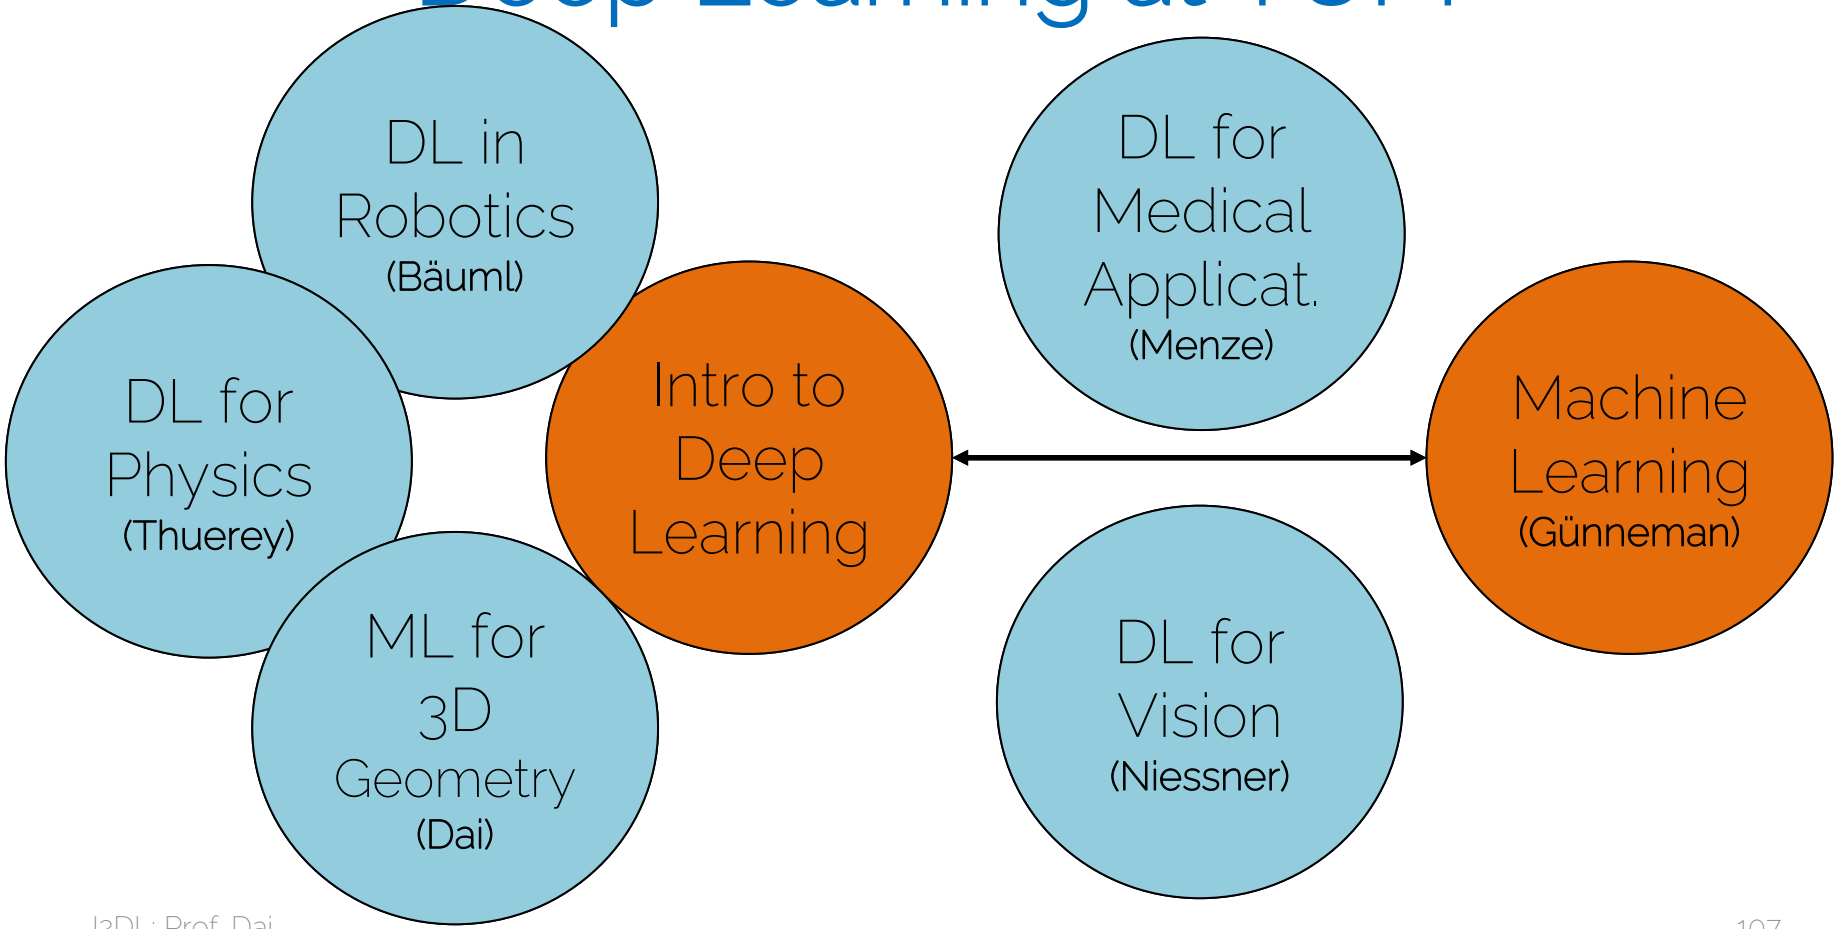


- GANs



Other DL Courses

Deep Learning at TUM



Deep Learning at TUM

- Keep expanding the courses on Deep Learning
- This Introduction to Deep Learning course is the basis for a series of Advanced DL lectures on different topics
- Advanced topics are only for Master students
  - Preparation for MA theses, etc.

Advanced DL for Computer Vision

- Deep Learning for Vision (Profs. Niessner)

- Syllabus
  - Advanced architectures, e.g., Siamese neural networks
  - Variational Autoencoders
  - Generative models, e.g. GAN,
  - Multi-dimensional CNN
  - Graph neural networks
  - Domain adaptation

Advanced DL for Computer Vision

- Deep Learning for Vision
  - 2 V + 3 P
  - **Must** have attended the Intro to DL

  - Practical part is a project that will last the whole semester
  - Please do not sign up unless you are willing to spend a lot of time on the project!

ML for 3D Geometry

- Lectures + Practical Project
  - Geometric foundations
  - Shape descriptors, similarity, segmentation
  - Shape modeling, reconstruction, synthesis
  - Deep learning for multi-view, volumetric, point cloud, and graph data

  - Prof. Dai

Next Dates and Exam

- Friday (31.01): Guest Lecture, Prof. Björn Ommer
  - Here in HS1!

- Exam date: **February 10th** at **18:30-20:00**
- There will NOT be a retake exam
- Neither cheat sheet nor calculator during the exam

Good Luck in the Exam ☺
