

Computer Vision II: Multiple View Geometry (IN2228)

Chapter 06 2D-2D Geometry (Part 2 Camera Pose Estimation)

Dr. Haoang Li

07 June 2022 12:00-13:30

Announcements before Class

➤ Supplementary Exercise Codes

- ✓ For some knowledge (e.g., computing normalized image coordinates and computing the relative camera pose from the absolute camera pose), our exercise sessions do not involve them due to time and space limit.
- ✓ As compensation, we are preparing some MATLAB codes to help you review some important knowledge that is not covered by our exercise sessions but is still highlighted in our review document (for Chapters 01--05).
- ✓ **Please note that it is optional for you to check these codes.**
- ✓ For details, please refer to <https://www.moodle.tum.de/mod/forum/discuss.php?d=431822>

Announcements before Class

➤ Update about Exercise Session Schedule

- ✓ For 2D-2D Geometry, we originally intend to introduce basic configuration (two views) and a more complex configuration (multiple views).
- ✓ Due to time limit, we skip the case of **multiple views** (last year, Prof. Cremers also skipped this part).
- ✓ Our lecture schedule remains unchanged. However, **we cancel the Exercise 7.**

Wed 31.05.2023 [Chapter 05: Correspondence Estimation \(Part 3\)](#)

Thu 01.06.2023 [Chapter 06: 2D-2D Geometry \(Part 1\)](#)

Wed 07.06.2023 [Chapter 06: 2D-2D Geometry \(Part 2\)](#)

Thu 08.06.2023 No lecture (Public Holiday)

Wed 14.06.2023 [Chapter 06: 2D-2D Geometry \(Part 3\)](#)

Thu 15.06.2023 [Chapter 07: 3D-2D Geometry \(Part 1\)](#)

Wed 21.06.2023 [Chapter 07: 3D-2D Geometry \(Part 2\)](#)

Thu 22.06.2023 [Chapter 08: 3D-3D Geometry](#)

Wed 28.06.2023 [Chapter 09: Single-view Geometry \(Part 1\)](#)

Thu 29.06.2023 [Chapter 09: Single-view Geometry \(Part 2\)](#)

Core part

Wed 14.06.2023 Exercise 6: Reconstruction from two views

Wed 21.06.2023 Exercise 7: **Reconstruction from multiple views**

Wed 05.07.2023 Exercise 8: Direct Image Alignment

Wed 12.07.2023 Exercise 9: Direct Image Alignment

Announcements before Class

➤ Notations and Formulas

✓ Problems

There are some inconsistent symbols in slides (e.g., intrinsic parameters).
Some equations and formulas are in the image format.

✓ Reasons

Some equations are copied from different academic papers.

✓ Solutions

We are adjusting notations and formulas. Due to limited time, the progress is relatively slow.
If some of them affect your understanding, please let me know (via email or Moodle) and I will prioritize their update.

Announcements before Class

- Correction for Rank Analysis (Tsai's Method)
- ✓ Q ($2n \times 12$) should have rank 11 to have a **unique (up-to-scale)** non-zero solution of vector M . ~~If rank equals 12, we only have zero solution.~~
- ✓ Dimension of null space is 1. Vector M can be expressed by a **single basis vector** multiplied by an arbitrary scalar.

$$Q \cdot M = 0$$

$2n \times 12$ matrix
(known)

12-dimensional vector
(unknown)

- ✓ Please refer to the updated page 14/48 of Chapter 04.

Explanation for Tsai's Method

➤ QR Decomposition

- ✓ Assume that we have computed M matrix based on DLT. We aim to recover intrinsic matrix K , rotation matrix R , and translation vector t .

$$\text{known } \boxed{M} = \boxed{K(R | t)}$$

- ✓ First step: re-write the right-hand side based on distributive law

$$M = K [R | t] = [KR | Kt]$$

- ✓ Second step: use **RQ** decomposition to decompose the known KR to obtain K and R .
Note: QR decomposition is a generic term that may refer to QR, QL, RQ, and LQ decompositions, with L being a lower triangular matrix.

(https://en.wikipedia.org/wiki/QR_decomposition#Relation_to_RQ_decomposition)

- ✓ Third step: compute t based on the known Kt and the estimated K .

Today's Outline

- Five-point Method
- Pose Recovery from Essential matrix
- 1D Correspondence Search
- Homography

Five-point Method

➤ Review on Rank and Null Space

- ✓ An example
- Computing a 3D line L orthogonal to normal N

Given a line N, find a orthogonal L

- $\langle N, L \rangle = 0$
Dot product
- $N^T L = 0$
A linear system
- $\{b_1, b_2\}$
Basis of null space

$N: 1 \times 3$

$\text{Num(unknowns)} = \text{Rank}(N) + \text{Dim(null space)}$

i.e., dimension of L

3	1	2
---	---	---

$N = \begin{pmatrix} \cdot \\ \cdot \\ \cdot \end{pmatrix}$

Five-point Method

➤ Two Properties of Essential Matrix

- ✓ Recap on definition of essential matrix

$$E = [t]^{\wedge} R$$

- ✓ Properties of essential matrix

$$\det(E) = 0 \quad \swarrow \text{Scalar}$$

$$\det([t]^{\wedge}) = 0 \quad \text{Rank}([t]^{\wedge}) = 2$$

$$\det(\mathbf{A}_1 \mathbf{A}_2 \cdots \mathbf{A}_n) = \det(\mathbf{A}_1) \det(\mathbf{A}_2) \cdots \det(\mathbf{A}_n)$$

$$EE^T E - \frac{1}{2} \text{trace}(EE^T) E = 0 \quad \longleftarrow \text{3*3 zero matrix}$$

Five-point Method

➤ Revisiting Eight-point Method

✓ Linear System

8 points correspondences

$$\begin{bmatrix} u_2^1 u_1^1 & u_2^1 v_1^1 & u_2^1 & v_2^1 u_1^1 & v_2^1 v_1^1 & v_2^1 & u_1^1 & v_1^1 & 1 \\ u_2^2 u_1^2 & u_2^2 v_1^2 & u_2^2 & v_2^2 u_1^2 & v_2^2 v_1^2 & v_2^2 & u_1^2 & v_1^2 & 1 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ u_2^n u_1^n & u_2^n v_1^n & u_2^n & v_2^n u_1^n & v_2^n v_1^n & v_2^n & u_1^n & v_1^n & 1 \end{bmatrix} \begin{bmatrix} e_0 \\ e_1 \\ e_2 \\ e_3 \\ e_4 \\ e_5 \\ e_6 \\ e_7 \\ e_8 \end{bmatrix} = 0$$

$$\begin{matrix} 9 \times 1 \\ Qe = 0 \\ N \times 9 \end{matrix}$$

- Each correspondence can provide one constraint.
- The minimal case of Q is 8*9 if we neglect the inherent constraints of elements of e.
- The minimal case is **5** correspondences if we consider these constraints. (we no longer solve a linear system)

✓ Definition of E matrix

$$E = [T_{\times}]R \quad \text{essential matrix}$$

- R has three degrees of freedom
- T has two degrees of freedom
- E has five degrees of freedom
- Rank of E equals five

$$\begin{matrix} & & 5 \times 9 \\ & & \uparrow \\ \text{Dim}(e) = & \text{Rank}(Q) + & \text{Dim}(\text{null space}) \\ 9 & 5 & 4 \end{matrix}$$

Five-point Method

➤ Polynomial Generation

- ✓ Basis of null space

Basis vector

X, Y, Z, W

$\text{Dim}(\text{null space}) = 4$

Known 9D basis vectors computed based on the known 5*9 coefficient matrix

- ✓ Linear expression of vector e

$$e = xX + yY + zZ + wW$$

x, y, z are unknown coefficients

$w = 1$

- ✓ Constraints of E matrix

$$\det(E) = 0$$

1 constraint

$$EE^T E - \frac{1}{2} \text{trace}(EE^T) E = 0$$

9 constraints (only two of them are linear independent)

$$Qe = 0$$

$$E = \begin{bmatrix} e_{11} & e_{12} & e_{13} \\ e_{21} & e_{22} & e_{23} \\ e_{31} & e_{32} & e_{33} \end{bmatrix}$$

A polynomial system with respect to unknown x, y , and z

Five-point Method

➤ Polynomial Generation

✓ Polynomial System

Unknown vector with respect to x, y, z $[x^3, y^3, x^2y, xy^2, x^2z, x^2, y^2z, y^2, xyz, xy, xz^2, xz, x, yz^2, yz, y, z^3, z^2, z, 1].$

$$A p = 0$$

Known coefficient matrix

A	x^3	y^3	x^2y	xy^2	x^2z	x^2	y^2z	y^2	xyz	xy	x	y	1
$\langle a \rangle$	1	[2]	[2]	[3]
$\langle b \rangle$		1	[2]	[2]	[3]
$\langle c \rangle$			1	[2]	[2]	[3]
$\langle d \rangle$				1	[2]	[2]	[3]
$\langle e \rangle$					1	[2]	[2]	[3]
$\langle f \rangle$						1	[2]	[2]	[3]
$\langle g \rangle$							1	.	.	.	[2]	[2]	[3]
$\langle h \rangle$								1	.	.	[2]	[2]	[3]
$\langle i \rangle$									1	.	[2]	[2]	[3]
$\langle j \rangle$										1	[2]	[2]	[3]

10 rows (10 equations)

➡ A 10-th degree univariate polynomial with respect to z

$$e = xX + yY + \boxed{z}Z + wW$$

$W = 1$

Computed coefficients

Solving this non-linear system will not be asked in the exam

Pose Recovery from Essential matrix

➤ Essential Matrix Decomposition

- ✓ Assume that we have obtained an essential matrix E . Recall that essential matrix E encodes the camera pose information. We aim to recover rotation and translation from the matrix E .

$$E = [T_{\times}]R \quad \text{essential matrix}$$

- ✓ Recap on singular value decomposition

$$T = U \Sigma V^{-1}$$

Composed of orthogonal basis vectors

Pose Recovery from Essential matrix

➤ Essential Matrix Decomposition

✓ Lemma: singular value of 3*3 Essential matrix satisfies the form $[\sigma, \sigma, 0]^T$
We do not provide proof here. If you have interest, you can check the reference [1]

✓ Decomposition of essential matrix E
Mathematical and geometric forms

$$E = U\Sigma V^T = U \begin{bmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & 0 \end{bmatrix} V^T = \underline{[t]^\wedge} \underline{R.}$$

Mathematical form

Geometric form

[1] "Multiple View Geometry in Computer Vision": R. Hartley and A. Zisserman

Link: <https://www.robots.ox.ac.uk/~vgg/hzbook/>

Pose Recovery from Essential matrix

➤ Essential Matrix Decomposition

- ✓ Can we directly extract R and t from SVD result?

$U \cdot \Sigma$ not skew-symmetric

$$E = U \Sigma V^T = U \begin{bmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & 0 \end{bmatrix} V^T = [\mathbf{t}]^\wedge R$$

We have to further transform it

Skew-symmetric matrix

We cannot directly extract t and R (no skew-symmetric matrix)

- ✓ Rewrite Σ by matrix multiplication (not unique)

$$\Sigma = \begin{bmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & a & 0 \\ -a & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Pose Recovery from Essential matrix

➤ Essential Matrix Decomposition

✓ Decomposition of essential matrix

SVD of E Decomposition of Σ

$$E = U \begin{bmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & 0 \end{bmatrix} V^T = U \begin{bmatrix} 0 & a & 0 \\ -a & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} V^T$$

$$= U \begin{bmatrix} 0 & a & 0 \\ -a & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \underbrace{U^T U}_{\text{Identity}} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} V^T = \underbrace{[t]^\wedge}_{\text{Skew-symmetric matrix}} R$$

Associative law

Introducing an **identity**
matrix for derivation

Pose Recovery from Essential matrix

➤ Essential Matrix Decomposition

✓ Rotation and translation results

$$[t_1]^\wedge = U \begin{bmatrix} 0 & a & 0 \\ -a & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} U^T = \left[\underset{\substack{\uparrow \\ \text{Matrix}}}{U} \begin{bmatrix} 0 \\ 0 \\ a \end{bmatrix} \right]^\wedge$$

3*1 vector

$$\Rightarrow \boxed{t_1} = U \begin{bmatrix} 0 \\ 0 \\ a \end{bmatrix} = \underset{\text{Columns}}{[U_0 \quad U_1 \quad U_2]} \begin{bmatrix} 0 \\ 0 \\ a \end{bmatrix} = \boxed{U_2 a}$$

Translation

$$U \begin{bmatrix} 0 & a & 0 \\ -a & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} U^T U \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} V^T = \boxed{[t]^\wedge} \boxed{R}$$

$$R_1 = U \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} V^T$$

Rotation

Pose Recovery from Essential matrix

➤ Essential Matrix Decomposition

✓ Another decomposition of Σ leads to another result

$$\Sigma = \begin{bmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & -a & 0 \\ a & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\Rightarrow \left\{ \begin{array}{l} \boxed{t_2} = U \begin{bmatrix} 0 \\ 0 \\ -a \end{bmatrix} = -U_2 a = \boxed{-t_1} \\ \\ R_2 = U \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} V^T \triangleq UW^T V^T \end{array} \right.$$

Another rotation and translation results

$$\Sigma = \begin{bmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & a & 0 \\ -a & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Previous decomposition

$$\begin{array}{l} t_1 = U \begin{bmatrix} 0 \\ 0 \\ a \end{bmatrix} = [U_0 \ U_1 \ U_2] \begin{bmatrix} 0 \\ 0 \\ a \end{bmatrix} = \boxed{U_2 a} \\ \\ R_1 = U \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} V^T \end{array}$$

Previous rotation and translation result

Pose Recovery from Essential matrix

➤ Essential Matrix Decomposition

✓ A more concise expression of rotation and translation

Rotation derived before

$$R_1 = U \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} V^T \quad R_2 = U \begin{bmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} V^T :$$

$$\Sigma = \begin{bmatrix} a & 0 & 0 \\ 0 & a & 0 \\ 0 & 0 & 0 \end{bmatrix} \quad \text{Defined before (eigen values)}$$

$$R_1 = U R_z(+\frac{\pi}{2}) V^T, [\mathbf{t}_1]^\wedge = U R_z(+\frac{\pi}{2}) \Sigma U^T$$

$$R_2 = U R_z(-\frac{\pi}{2}) V^T, [\mathbf{t}_2]^\wedge = U R_z(-\frac{\pi}{2}) \Sigma U^T$$

$$[\mathbf{t}_1]^\wedge = U \begin{bmatrix} 0 & a & 0 \\ -a & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} U^T \quad \text{Translation derived before}$$

Pose Recovery from Essential matrix

➤ Essential Matrix Decomposition

- ✓ Four possible solutions: There exists only one solution where points are in front of both cameras

use 3D triangle to filter out

3D reconstruction will be introduced in the next class

Pose Recovery from Essential matrix

➤ Application of Fundamental Matrix

✓ Can R, T, K_1, K_2 be extracted from F ?

- In general we cannot achieve this since infinite solutions exist
- However, if the coordinates of the **principal points** of each camera are known and the two cameras have the same **focal length** f in pixels, then R, T, f can be determined uniquely.
- This is an advanced knowledge. We will not introduce it in our class.

- 一般来说，我们无法做到这一点，因为存在无限的解决方案

- 然而，如果每台摄像机的主点坐标是已知的，并且两台摄像机的焦距相同 ff ，那么 RR, TT, ff 可以唯一确定。

- 这是一个高级知识。我们不会在课堂上介绍它。

Pose Recovery from Essential matrix

➤ Application of Fundamental Matrix

❓ 如果我们不使用基本矩阵来恢复摄像机的姿势，它的应用是什么？

- 我们不需要对图像点进行标准化。

- 我们可以使用对基本矩阵的共识约束来消除离群值。

✓ If we do not use Fundamental matrix to recover camera pose, what is its application?

- We do not need to normalize image points.
- We can use consensus constraint w.r.t. fundamental matrix to remove outliers.

(a) 55 inliers (green) and 8 outliers (red) among 63 pairs

1D Correspondence Search

- Overview
 - ✓ Reviewing drawback of brute-force matching
 - ✓ 1D search based on epipolar constraint (**application of epipolar lines**)

1D Correspondence Search

- Review and Motivation 给定一个点, p_L , 在左图中, 我们如何找到它的对应关系, 一个直接的策略是蛮力匹配 (搜索) 策略。

Given a point, p_L , in the left image, how do we find its correspondence, p_R , in the right image?
A straightforward strategy is brute-force matching (search) strategy.

try all the points in this picture

Left image

Right image

1D Correspondence Search

➤ Review and Motivation

Brute-force Matching: compare each candidate patch from the image with all possible candidate patches from the right image.

Left image

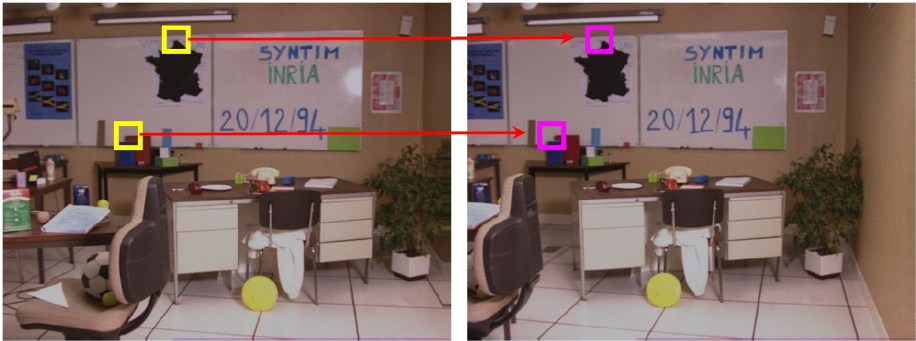

Right image

1D Correspondence Search

➤ Review and Motivation

This 2D exhaustive search is computationally very expensive!

1D Correspondence Search

- Problem Formulation
- 我们能不能把对应的搜索变成1D?
 - 上极线是背射线 $\pi^{-1}(p)$ 对另一摄像机图像的投影。
 - pp 的潜在匹配必须位于相应的表极线 l' 上。
- ✓ Can we make the correspondence search 1D?
- The epipolar line is the projection of a back projected ray $\pi^{-1}(p)$ onto the other camera image
 - Potential matches for p have to lie on the corresponding epipolar line l'

1D Correspondence Search

➤ Problem Formulation

- ✓ Corresponding points must lie along the epipolar lines: this constraint is called **epipolar constraint**.
- ✓ The epipolar constraint reduces correspondence problem to 1D search along the epipolar line.

❓ 对应的点必须位于上极线上：这种约束被称为上极约束。

❓ 上极约束将对应问题减少为沿上极线的一维搜索。

1D Correspondence Search

➤ Problem Formulation

Thanks to the epipolar constraint, corresponding points can be searched for along epipolar lines. Accordingly, the computational cost reduced to 1 dimension.

Left image

Right image

search
this
four
lines

1D Correspondence Search

➤ Example Configurations of Epipolar Lines

Fundamental: All the epipolar lines intersect at the epipole

- ① Intersection of camera lines and image plane
- ② Intersection of epipolar lines

1D Correspondence Search

➤ Example 1: Converging Cameras

✓ A classical case

As the position of the 3D point P changes, the epipolar lines **rotate about the baseline**

Left image

Right image

1D Correspondence Search

➤ Example 2: Identical and Horizontally-Aligned Cameras

✓ A special case

Parallel epipolar lines do not intersect (or, the intersection lies at the infinity).

Left image

Right image

Left image

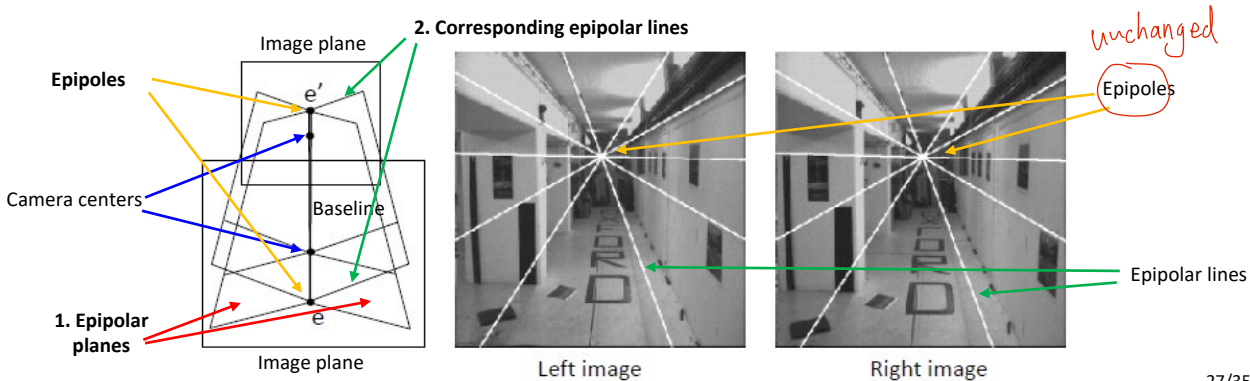

Right image

1D Correspondence Search

➤ Example 3: Forward Motion (Parallel to the Optical Axis)

✓ Another special case

Epipolar lines radiating from the epipole (coordinates remain unchanged)

Homography

➤ Relationship with Essential Matrix

✓ Similarity

- They both encode the relative pose information.
- Different point correspondences can be fitted by the same matrix.

✓ Difference

- Essential matrix is derived from arbitrary 3D points.
- Homography is derived from coplanar 3D points.

Arbitrary 3D points

3D points lying on the same 3D plane

Homography

➤ Definition

- ✓ 3D plane expression 3D point in the **left** camera frame

$$n^T P + d = 0$$

- ✓ Homography derivation

$$p_2 = K(RP + t) = K \left(RP + t \frac{n^T P}{-d} \right)$$

Homogeneous
coordinates

Perspective
projection in the **right**
camera frame

1

$$p_2 = K \left(R + t \frac{n^T}{-d} \right) \boxed{P} = K \left(R + t \frac{n^T}{-d} \right) \boxed{K^{-1} p_1}$$

Distributive law

Normalized image
coordinates

3D point P is projected to both
left and right image planes

Homography

➤ Definition

✓ Conclusion

We define homography matrix H as

$$p_2 = K \left(R + t \frac{n^T}{-d} \right) K^{-1} p_1 \Rightarrow p_2 = H p_1$$
$$H = K \left(R + t \frac{n^T}{-d} \right) K^{-1}$$

Homography encodes the relative camera pose information.

Homography

➤ Computation

- ✓ A pair of points in homogeneous coordinates satisfy the homography

$$q_2 \propto \mathbf{H}q_1$$

- ✓ We expand the above constraint

$$\begin{pmatrix} u_2 \\ v_2 \\ 1 \end{pmatrix} \propto \begin{pmatrix} \mathbf{H}_{11} & \mathbf{H}_{12} & \mathbf{H}_{13} \\ \mathbf{H}_{21} & \mathbf{H}_{22} & \mathbf{H}_{23} \\ \mathbf{H}_{31} & \mathbf{H}_{32} & \mathbf{H}_{33} \end{pmatrix} \begin{pmatrix} u_1 \\ v_1 \\ 1 \end{pmatrix}$$

Homography is up to scale and thus has **8 degrees of freedom**

Homography

➤ Computation

✓ Without loss of generality, we fix the last element of Homography to 1:

$$\begin{pmatrix} u_2 \\ v_2 \\ 1 \end{pmatrix} \propto \begin{pmatrix} \mathbf{H}_{11} & \mathbf{H}_{12} & \mathbf{H}_{13} \\ \mathbf{H}_{21} & \mathbf{H}_{22} & \mathbf{H}_{23} \\ \mathbf{H}_{31} & \mathbf{H}_{32} & \mathbf{H}_{33} \end{pmatrix} \begin{pmatrix} u_1 \\ v_1 \\ 1 \end{pmatrix} \Rightarrow \begin{pmatrix} u_2 \\ v_2 \\ 1 \end{pmatrix} \propto \begin{pmatrix} H_{11} & H_{12} & H_{13} \\ H_{21} & H_{22} & H_{23} \\ H_{31} & H_{32} & \boxed{1} \end{pmatrix} \begin{pmatrix} u_1 \\ v_1 \\ 1 \end{pmatrix}$$

✓ We re-write the matrix form into two constraints

$$\begin{cases} u_2 = \frac{H_{11}u_1 + H_{12}v_1 + H_{13}}{H_{31}u_1 + H_{32}v_1 + 1} \\ v_2 = \frac{H_{21}u_1 + H_{22}v_1 + H_{23}}{H_{31}u_1 + H_{32}v_1 + 1} \end{cases}$$

Homography

➤ Computation

- ✓ Each point correspondence provides **two** linear constraint.
- ✓ Linear system w.r.t. elements of Homography defined by **four** point correspondences.

$$\begin{cases} u_2 = \frac{H_{11}u_1 + H_{12}v_1 + H_{13}}{H_{31}u_1 + H_{32}v_1 + 1} \\ v_2 = \frac{H_{21}u_1 + H_{22}v_1 + H_{23}}{H_{31}u_1 + H_{32}v_1 + 1} \end{cases}$$

$$\begin{pmatrix} u_1^1 & v_1^1 & 1 & 0 & 0 & 0 & -u_1^1 u_2^1 & -v_1^1 u_2^1 \\ 0 & 0 & 0 & u_1^1 & v_1^1 & 1 & -u_1^1 v_2^1 & -v_1^1 v_2^1 \\ u_1^2 & v_1^2 & 1 & 0 & 0 & 0 & -u_1^2 u_2^2 & -v_1^2 u_2^2 \\ 0 & 0 & 0 & u_1^2 & v_1^2 & 1 & -u_1^2 v_2^2 & -v_1^2 v_2^2 \\ u_1^3 & v_1^3 & 1 & 0 & 0 & 0 & -u_1^3 u_2^3 & -v_1^3 u_2^3 \\ 0 & 0 & 0 & u_1^3 & v_1^3 & 1 & -u_1^3 v_2^3 & -v_1^3 v_2^3 \\ u_1^4 & v_1^4 & 1 & 0 & 0 & 0 & -u_1^4 u_2^4 & -v_1^4 u_2^4 \\ 0 & 0 & 0 & u_1^4 & v_1^4 & 1 & -u_1^4 v_2^4 & -v_1^4 v_2^4 \end{pmatrix} \begin{pmatrix} H_{11} \\ H_{12} \\ H_{13} \\ H_{21} \\ H_{22} \\ H_{23} \\ H_{31} \\ H_{32} \end{pmatrix} = \begin{pmatrix} u_2^1 \\ v_2^1 \\ u_2^2 \\ v_2^2 \\ u_2^3 \\ v_2^3 \\ u_2^4 \\ v_2^4 \end{pmatrix}$$

Homography

- Recovering Camera Pose from Homography
- ✓ Recall that Homography encodes the camera pose information

$$p_2 = H p_1$$

$$H = K \left(R + t \frac{n^T}{-d} \right) K^{-1}$$

- ✓ Assume that we have computed homography, we aim to recover rotation and translation.
- ✓ Two representative methods: [1] (popular method) and [2]

[1] Faugeras O D, Lustman F. Motion and structure from motion in a piecewise planar environment. 1988

[2] Ezio Malis, Manuel Vargas, and others. Deeper understanding of the homography decomposition for vision-based control. 2007

Summary

- Five-point Method
- Pose Recovery from Essential Matrix
- 1D Correspondence Search
- Homography

Thank you for your listening!
If you have any questions, please come to me :-)
